Form No. S12A
表格第 S12A 號

APPLICATION FOR AMENDMENT OF PLAN UNDER SECTION 12A OF THE TOWN PLANNING ORDINANCE (CAP.131)

根據《城市規劃條例》(第131章)第12A條遞交的修訂圖則申請

Applicant who would like to publish the notice of application in local newspapers to meet one of the Town Planning Board's requirements of taking reasonable steps to obtain consent of or give notification to the current land owner, please refer to the following link regarding publishing the notice in the designated newspapers: https://www.info.gov.hk/tpb/en/plan_application/apply.html

申請人如欲在本地報章刊登申請通知，以採取城市規劃委員會就取得現行土地擁有人的同意或通知現行土地擁有人所指定的其中一項合理步驟，請瀏覽以下網址有關在指定的報章刊登通知：https://www.info.gov.hk/tpb/tc/plan_application/apply.html

General Note and Annotation for the Form
填寫表格的一般指引及註解

"Current land owner" means any person whose name is registered in the Land Registry as that of an owner of the land to which the application relates, as at 6 weeks before the application is made
「現行土地擁有人」指在提出申請前六星期，其姓名或名稱已在土地註冊處註冊為該申請所關乎的土地的擁有人的人

& Please attach documentary proof 請夾附證明文件

^ Please insert number where appropriate 請在適當地方註明編號

Please fill "NA" for inapplicable item 請在不適用的項目填寫「不適用」

Please use separate sheets if the space provided is insufficient 如所提供的空間不足，請另頁說明

Please insert a「✔」at the appropriate box 請在適當的方格內上加上「✔」號

For Official Use Only 請勿填寫此欄	Application No. 申請編號	
	Date Received 收到日期	

1. The completed form and supporting documents (if any) should be sent to the Secretary, Town Planning Board (the Board), 15/F, North Point Government Offices, 333 Java Road, North Point, Hong Kong.
申請人須把填妥的申請表格及其他支持申請的文件 (倘有)，送交香港北角渣華道 333 號北角政府合署 15 樓城市規劃委員會(下稱「委員會」)秘書收。

2. Please read the "Guidance Notes" carefully before you fill in this form. The document can be downloaded from the Board's website at http://www.info.gov.hk/tpb/. It can also be obtained from the Secretariat of the Board at 15/F, North Point Government Offices, 333 Java Road, North Point, Hong Kong (Tel: 2231 4810 or 2231 4835), and the Planning Enquiry Counters of the Planning Department (Hotline: 2231 5000) (17/F, North Point Government Offices, 333 Java Road, North Point, Hong Kong and 14/F, Sha Tin Government Offices, 1 Sheung Wo Che Road, Sha Tin, New Territories).
請先細閱《申請須知》的資料單張，然後填寫此表格。該份文件可從委員會的網頁下載 (網址：http://www.info.gov.hk/tpb/)，亦可向委員會秘書處 (香港北角渣華道 333 號北角政府合署 15 樓 – 電話：2231 4810 或 2231 4835)及規劃署的規劃資料查詢處(熱線：2231 5000) (香港北角渣華道 333 號北角政府合署 17 樓及新界沙田上禾輋路 1 號沙田政府合署 14 樓)索取。

3. This form can be downloaded from the Board's website, and obtained from the Secretariat of the Board and the Planning Enquiry Counters of the Planning Department. The form should be typed or completed in block letters. The processing of the application may be refused if the required information or the required copies are incomplete.
此表格可從委員會的網頁下載，亦可向委員會秘書處及規劃署的規劃資料查詢處索取。申請人須以打印方式或以正楷填寫表格。如果申請人所提交的資料或文件副本不齊全，委員會可拒絕處理有關申請。

---

1. Name of Applicant 申請人姓名/名稱

(☐ Mr. 先生 / ☐ Mrs. 夫人 / ☐ Miss 小姐 / ☐ Ms. 女士 / ☑ Company 公司 / ☐ Organisation 機構)

Bright Strong Ltd.

2. Name of Authorised Agent (if applicable) 獲授權代理人姓名/名稱（如適用）

(☐ Mr. 先生 / ☐ Mrs. 夫人 / ☐ Miss 小姐 / ☐ Ms. 女士 / ☑ Company 公司 / ☐ Organisation 機構)

Llewelyn-Davies Hong Kong Limited

3. Application Site 申請地點

(a) Whether the application directly relates to any specific site? 申請是否直接與某地點有關？	Yes 是 ☑ No 否 ☐ （Please proceed to Part 6 請繼續填寫第 6 部分）
(b) Full address/ location/ demarcation district and lot number (if applicable) 詳細地址／地點／丈量約份及地段號碼（如適用）	Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D.107 and Adjoining Government Land, West of Castle Peak Road - Tam Mi, Yuen Long
(c) Site Area 申請地點面積	81,550 sq.m 平方米 ☑ About 約

(d) Area of Government land included (if any) 所包括的政府土地面積 (倘有)	15,714 sq.m 平方米 ☑ About 約
(e) Current use(s) 現時用途	The northern part of the Application Site is zoned "I(D)", occupied by an existing soy sauce factory which is in operation, and some unused land and scattered temporary structures. The southern portion of the Application Site falls within the "OS" zone is currently use as open storage yard. (If there are any Government, institution or community facilities, please illustrate on plan and specify the use and gross floor area) (如有任何政府、機構或社區設施，請在圖則上顯示，並註明用途及總樓面面積)

4. "Current Land Owner" of Application Site 申請地點的「現行土地擁有人」

The applicant 申請人 –

☐ is the sole "current land owner"#& (please proceed to Part 6 and attach documentary proof of ownership).
是唯一的「現行土地擁有人」#& (請繼續填寫第 6 部分，並夾附業權證明文件)。

☑ is one of the "current land owners"#& (please attach documentary proof of ownership).
是其中一名「現行土地擁有人」#& (請夾附業權證明文件)。

☐ is not a "current land owner"#.
並不是「現行土地擁有人」#。

☐ The application site is entirely on Government land (please proceed to Part 6).
申請地點完全位於政府土地上（請繼續填寫第 6 部分）。

5. Statement on Owner's Consent/Notification 就土地擁有人的同意/通知土地擁有人的陳述

(a) According to the record(s) of the Land Registry as at 24 Feb 2022 (DD/MM/YYYY), this application involves a total of 2 "current land owner(s) "#.
根據土地註冊處截至 …… 年 …… 月 …… 日的記錄，這宗申請共牽涉 …… 名「現行土地擁有人」#。

(b) The applicant 申請人 –

☐ has obtained consent(s) of …… "current land owner(s)"#.
已取得 …… 名「現行土地擁有人」#的同意。

Details of consent of "current land owner(s)"# obtained 取得「現行土地擁有人」#同意的詳情		
No. of 'Current Land Owner(s)' 「現行土地擁有人」數目	Lot number/address of premises as shown in the record of the Land Registry where consent(s) has/have been obtained 根據土地註冊處記錄已獲得同意的地段號碼／處所地址	Date of consent obtained (DD/MM/YYYY) 取得同意的日期 (日/月/年)

(Please use separate sheets if the space of any box above is insufficient. 如上列任何方格的空間不足，請另頁說明）

☐ has notified …… "current land owner(s)"#
已通知 …… 名「現行土地擁有人」#。

Details of the "current land owner(s)" # notified 已獲通知「現行土地擁有人」#的詳細資料		
No. of 'Current Land Owner(s)' 「現行土地擁有人」數目	Lot number/address of premises as shown in the record of the Land Registry where notification(s) has/have been given 根據土地註冊處記錄已發出通知的地段號碼／處所地址	Date of notification given (DD/MM/YYYY) 通知日期(日/月/年)

(Please use separate sheets if the space of any box above is insufficient. 如上列任何方格的空間不足，請另頁說明）

☑ has taken reasonable steps to obtain consent of or give notification to owner(s):
已採取合理步驟以取得土地擁有人的同意或向該人發給通知。詳情如下：

Reasonable Steps to Obtain Consent of Owner(s) 取得土地擁有人的同意所採取的合理步驟

☐ sent request for consent to the "current land owner(s)"#& on _____ (DD/MM/YYYY)
於_____(日/月/年)向每一名「現行土地擁有人」#郵遞要求同意書&

Reasonable Steps to Give Notification to Owner(s) 向土地擁有人發出通知所採取的合理步驟

☑ published notices in local newspapers& on 25 Feb 2022 (DD/MM/YYYY)
於_____(日/月/年)在指定報章就申請刊登一次通知&

☑ posted notice in a prominent position on or near application site/premises& on
24 Feb 2022 (DD/MM/YYYY)
於_____(日/月/年)在申請地點／申請處所或附近的顯明位置貼出關於該申請的通知&

☐ sent notice to relevant owners' corporation(s)/owners' committee(s)/mutual aid committee(s)/management office(s) or rural committee& on _____ (DD/MM/YYYY)
於_____(日/月/年)把通知寄往相關的業主立案法團/業主委員會/互助委員會或管理處，或有關的鄉事委員會&

Others 其他

☐ others (please specify)
其他（請指明）

_____

_____

_____

_____

Note: May insert more than one「✔」.
Information should be provided on the basis of each and every lot (if applicable) and premises (if any) in respect of the application.
註: 可在多於一個方格內加上「✔」號
申請人須就申請涉及的每一地段（倘適用）及處所（倘有）分別提供資料

6. Plan Proposed to be Amended 擬議修訂的圖則

(a) Name and number of the related statutory plan(s) 有關法定圖則的名稱及編號	Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8
(b) Land use zone(s) involved (if applicable) 涉及的土地用途地帶(如適用)	"Industrial (Group D)", "Open Storage" and 'Road'

7. Proposed Amendments 擬議修訂

(a) Propose to rezone the application site to the following zone(s)/use(s)
(May insert more than one「✔」) (Please illustrate the details on plan)
建議將申請地點的用途地帶改劃作下列地帶 / 用途
(可在多於一個方格內加上「✔」號) (請在圖則顯示詳情)

☐ Comprehensive Development Area [ ]
綜合發展區 [ ]

☑ Residential (Group ☐A/☐B/☐C/☐D/☑E) [ ]
住宅 (☐甲類 / ☐乙類 / ☐丙類 / ☐丁類 / ☐戊類) [ ]

☐ Agriculture [ ] 農業 [ ]

☐ Industrial (Group D) [ ] 工業（丁類）[ ]

☐ Government, Institution or Community [ ]
政府、機構或社區 [ ]

☐ Recreation [ ] 康樂 [ ]

☐ Country Park [ ] 郊野公園 [ ]

☐ Conservation Area [ ] 自然保育區 [ ]

☐ Commercial [ ] 商業 [ ]

☐ Village Type Development [ ]
鄉村式發展 [ ]

☐ Industrial [ ] 工業 [ ]

☐ Open Storage [ ] 露天貯物 [ ]

☐ Open Space [ ] 休憩用地 [ ]

☐ Green Belt [ ] 綠化地帶 [ ]

☐ Coastal Protection Area [ ]
海岸保護區 [ ]

☐ Site of Special Scientific Interest [ ]
具特殊科學價值地點 [ ]

☐ Other Specified Uses (☐Business/☐Industrial Estate/☐Mixed Use/☐Rural Use/☐Petrol Filling Station/
☐Others (please specify_____)) [ ]
其他指定用途 (☐商貿 / ☐工業邨 / ☐混合用途 / ☐鄉郊用途 / ☐加油站 /
☐ 其他 (請註明：_____)) [ ]

☐ Road 道路

☐ Others (please specify_____)
其他 (請註明：_____)

Please insert subzone in [ ] as appropriate.
請於[ ]內註明支區，如適用。

(b) Propose to amend the Notes of the Plan(s) 建議修訂圖則的《註釋》

☐ Covering Notes 《註釋》說明頁

☑ Notes of the zone applicable to the Site 適用於申請地點土地用途地帶的《註釋》

Details of the proposed amendment(s) to the Notes of the Plan, where appropriate, are as follows:
(Please use separate sheets if the space below is insufficient)
建議修訂圖則的《註釋》的詳情，如適用：
(如下列空間不足，請另頁說明)

Please refer to Appendix A of the attached Planning Statement.

☑ Proposed Notes of Schedule of Uses of the zone attached
夾附對《 註釋 》的擬議修訂

8. Details of Proposed Amendment (if any) 擬議修訂詳情 (倘有)

☑ Particulars of development are included in the **Appendix**.
附錄包括一個擬議發展的細節。

☐ No specific development proposal is included in this application.
這宗申請並不包括任何指定的擬議發展計劃。

9. Justifications 理由

The applicant is invited to provide justifications in support of the application. Use separate sheets if necessary.
現請申請人提供申請理由及支持其申請的資料。如有需要請另頁說明。

Please refer to the attached Planning Statement.

10. Declaration 聲明

I hereby declare that the particulars given in this application are correct and true to the best of my knowledge and belief.
本人謹此聲明，本人就這宗申請提交的資料，據本人所知及所信，均屬真實無誤。

I hereby grant a permission to the Board to copy all the materials submitted in this application and/or to upload such materials to the Board's website for browsing and downloading by the public free-of-charge at the Board's discretion.
本人現准許委員會酌情將本人就此申請所提交的所有資料複製及/或上載至委員會網站，供公眾免費瀏覽或下載。

Signature 簽署 ..... ☐ Applicant 申請人 / ☑ Authorised Agent 獲授權代理人

Llewelyn-Davies Hong Kong Limited
Authorized Signature

on behalf of 代表 ..... Llewelyn-Davies Hong Kong Limited .....
☑ Company 公司 / ☐ Organisation Name and Chop (if applicable) 機構名稱及蓋章（如適用）

Date 日期 ..... 28 Feb 2022 ..... (DD/MM/YYYY 日/月/年)

Remark 備註

The materials submitted in this application and the Board's decision on the application would be disclosed to the public. Such materials would also be uploaded to the Board's website for browsing and free downloading by the public where the Board considers appropriate.
委員會會向公眾披露申請人所遞交的申請資料和委員會對申請所作的決定。在委員會認為合適的情況下，有關申請資料亦會上載至委員會網頁供公眾免費瀏覽及下載。

Warning 警告

Any person who knowingly or wilfully makes any statement or furnish any information in connection with this application, which is false in any material particular, shall be liable to an offence under the Crimes Ordinance.
任何人在明知或故意的情況下，就這宗申請提出在任何要項上是虛假的陳述或資料，即屬違反《刑事罪行條例》。

Statement on Personal Data 個人資料的聲明

1. The personal data submitted to the Board in this application will be used by the Secretary of the Board and Government departments for the following purposes:
委員會就這宗申請所收到的個人資料會交給委員會秘書及政府部門，以根據《城市規劃條例》及相關的城市規劃委員會規劃指引的規定作以下用途：

   (a) the processing of this application which includes making available the name of the applicant for public inspection when making available this application for public inspection; and
   處理這宗申請，包括公布這宗申請供公眾查閱，同時公布申請人的姓名供公眾查閱；以及
   (b) facilitating communication between the applicant and the Secretary of the Board/Government departments.
   方便申請人與委員會秘書及政府部門之間進行聯絡。

2. The personal data provided by the applicant in this application may also be disclosed to other persons for the purposes mentioned in paragraph 1 above.
申請人就這宗申請提供的個人資料，或亦會向其他人士披露，以作上述第 1 段提及的用途。

3. An applicant has a right of access and correction with respect to his/her personal data as provided under the Personal Data (Privacy) Ordinance (Cap. 486). Request for personal data access and correction should be addressed to the Secretary of the Board at 15/F, North Point Government Offices, 333 Java Road, North Point, Hong Kong.
根據《個人資料(私隱)條例》(第 486 章)的規定，申請人有權查閱及更正其個人資料。如欲查閱及更正個人資料，應向委員會秘書提出有關要求，其地址為香港北角渣華道 333 號北角政府合署 15 樓。

APPLICATION FOR AMENDMENT OF PLAN UNDER SECTION 12A OF THE TOWN PLANNING ORDINANCE (CAP. 131)
根據城市規劃條例(第 131 章)第 12A 條遞交的修訂圖則申請

(For Residential Portion; based on the Development Site of the Residential Portion of about 46,501sqm.)

Domestic: 115,942;
Commercial uses: 6,000
Covered transport lay-by: 3,000

Development Proposal (only for indicative purpose)
擬議發展的發展計劃（只作指示用途）

Domestic: Not more than 2.5
Commercial: Not more than 0.13
Covered transport lay-by: Not more than 0.07

1. Development Proposal 擬議發展計劃

☑ Proposed Gross floor area (GFA) 擬議總樓面面積	..... sq.m. 平方米	☑ About 約
☑ Proposed plot ratio 擬議地積比率	.....	☐ About 約
☑ Proposed site coverage 擬議上蓋面積	Domestic: <33.33%; Non-domestic: <100 %	☐ About 約
☑ Proposed number of blocks 擬議座數	Towers: 11; Clubhouse: 1	
☑ Proposed number of storeys of each block 每座建築物的擬議層數	Please refer to Sheet 1 storeys 層 ☐ include 包括 ..... storeys of basements 層地庫 ☐ exclude 不包括 ..... storeys of basements 層地庫	
☑ Proposed building height of each block 每座建築物的擬議高度	Please refer to Sheet 1 m 米	☐ About 約
	..... mPD 米(主水平基準上)	☐ About 約
☑ Domestic part 住用部分		
GFA 總樓面面積	115,942 sq.m. 平方米	☑ About 約
number of units 單位數目	3,115	
average unit size 單位平均面積	37.2 sq.m. 平方米	☑ About 約
estimated number of residents 估計住客數目	8,099	
	GFA 總樓面面積	
☑ Non-domestic part 非住用部分	..... sq.m.平方米	☑ About 約
☐ hotel 酒店	..... sq.m.平方米	☐ About 約
	(please specify the number of rooms 請註明房間數目: .....)	
☐ office 辦公室	..... sq.m.平方米	☐ About 約
☐ shop and services/eating place 商店及服務行業/食肆	..... sq.m.平方米	☐ About 約
☐ Government, institution or community facilities 政府、機構或社區設施	(please specify the use(s) and concerned land area(s)/GFA(s)) (請註明用途及有關的地面面積/總樓面面積)	
☑ other(s)其他	(please specify the use(s) and concerned land area(s)/GFA(s)) (請註明用途及有關的地面面積/總樓面面積)	
# Including 'Shop and Services', 'Eating Place', 'School' (nurser / kindergarten / language, computer, commercial or tutorial schools / technical institutes / other types of schools providing interests and hobby related courses for subjects such as arts, ballet and etc.), 'Place of Entertainment' and 'Place of Recreation, Sports or Culture' Uses.	Covered Transport Lay-by - about 3,000 sq.m.	
@ Exempted from plot ratio and GFA calculation	Commercial Uses# - about 6,000 sq.m.	
	Clubhouse Facilities@ - about 3,500 sq.m.	
☑ Open space 休憩用地	(please specify land area(s)) (請註明面積)	
☑ private open space 私人休憩用地	8,099 sq.m.平方米	☑ Not less than 不少於
☐ public open space 公共休憩用地	..... sq.m.平方米	☐ Not less than 不少於

1. Development Proposal (For Residential Portion)

☑ Transport-related facilities 與運輸有關的設施

☑ parking spaces 停車位 (please specify type(s) and number(s)) (請註明種類及數目)

Private Car Parking Spaces 私家車車位	Total: 358* (Residential: 284; Visitors: 55; Commercial: 14, Kindergarten: 5)
Motorcycle Parking Spaces 電單車車位	Total: 27 (Residential: 25; Commercial: 2)
Light Goods Vehicle Parking Spaces 輕型貨車泊車位	
Medium Goods Vehicle Parking Spaces 中型貨車泊車位	
Heavy Goods Vehicle Parking Spaces 重型貨車泊車位	
Others (Please Specify) 其他 (請列明)	

* Accessible car parking spaces will be reserved for person with disablilities in accordance with the HKPSG

☑ loading/unloading spaces 上落客貨車位 (please specify type(s) and number(s)) (請註明種類及數目)

Taxi Spaces 的士車位	Total: 4
Coach Spaces 旅遊巴車位	
Light Goods Vehicle Spaces 輕型貨車車位	Total Loading/Unloading Bays: 14 (Residential: 11; Commercial: 3)
Medium Goods Vehicle Spaces 中型貨車車位	
Heavy Goods Vehicle Spaces 重型貨車車位	
Others (Please Specify) 其他 (請列明)	Small Coach Lay-bys: 15 (7m x3m each) (for kindergarten)

☑ other transport-related facilities 其他與運輸有關的設施 (please specify type(s) and number(s)) (請註明種類及數目)

Covered Transport Lay-by: 1

Use(s) of different floors (if applicable) 各樓層的用途(如適用)

[Block number] [座數]	[Floor(s)] [層數]	[Proposed use(s)] [擬議用途]
Please refer to Sheet 1		

Proposed use(s) of uncovered area (if any) 露天地方(倘有)的擬議用途

Landscaped Areas, Private Gardens, Swimming Pool, L/UL Bays and Driveway.

Any vehicular access to the site? 是否有車路通往地盤?

Yes 是 ☑ There is an existing access. (please indicate the street name, where appropriate)
有一條現有車路。(請註明道路名稱(如適用))
Castle Peak Road - Tam Mi Section

☐ There is a proposed access. (please illustrate on plan and specify the width)
有一條擬議車路。(請在圖則顯示，並註明車路的闊度)

No 否 ☐

For Development involving columbarium use, please complete the table in the Annex to this Appendix.
如發展涉及靈灰安置所用途，請填妥於此附件後附錄的表格。

APPLICATION FOR AMENDMENT OF PLAN UNDER SECTION 12A OF THE TOWN PLANNING ORDINANCE (CAP. 131)

根據城市規劃條例(第 131 章)第 12A 條遞交的修訂圖則申請

(For Relocated Soy Sauce Factory Portion;
Based on the Development Site of the Relocated Soy Sauce Factory Portion of about 27,459sqm.)

Development Proposal (only for indicative purpose)

擬議發展的發展計劃（只作指示用途）

1. Development Proposal 擬議發展計劃

☑ Proposed Gross floor area (GFA) 擬議總樓面面積	13,700 # sq.m. 平方米	☑ About 約
☑ Proposed plot ratio 擬議地積比率	0.5	☑ About 約
☑ Proposed site coverage 擬議上蓋面積	Non-domestic: 100 %	☐ About 約
☑ Proposed number of blocks 擬議座數	1	
☐ Proposed number of storeys of each block 每座建築物的擬議層數	..... storeys 層 ☐ include 包括.....storeys of basements 層地庫 ☐exclude 不包括.....storeys of basements 層地庫	
☑ Proposed building height of each block 每座建築物的擬議高度	Not more than 8m # m 米	☐ About 約
	..... mPD 米(主水平基準上)	☐ About 約
☐ Domestic part 住用部分		
GFA 總樓面面積	..... sq.m. 平方米	☐ About 約
number of units 單位數目	.....	
average unit size 單位平均面積	..... sq.m. 平方米	☐ About 約
estimated number of residents 估計住客數目	.....	
	GFA 總樓面面積	
☑ Non-domestic part 非住用部分	13,700 sq.m.平方米	☑ About 約
☐ hotel 酒店	..... sq.m.平方米	☐ About 約
	(please specify the number of rooms 請註明房間數目: .....)	
☐ office 辦公室	..... sq.m.平方米	☐ About 約
☐ shop and services/eating place 商店及服務行業/食肆	..... sq.m.平方米	☐ About 約
☐ Government, institution or community facilities 政府、機構或社區設施	(please specify the use(s) and concerned land area(s)/GFA(s)) (請註明用途及有關的地面面積/總樓面面積)	
☐ other(s)其他	(please specify the use(s) and concerned land area(s)/GFA(s)) (請註明用途及有關的地面面積/總樓面面積)	
☐ Open space 休憩用地	(please specify land area(s)) (請註明面積)	
☐ private open space 私人休憩用地	..... sq.m.平方米	☐ Not less than 不少於
☐ public open space 公共休憩用地	..... sq.m.平方米	☐ Not less than 不少於

In order to facilitate the future operation of the relocated soy sauce factory, about 7,300sq.m. of the floor area of the future plant room will have a high headroom of about 8m and about 6,400sq.m. of the floor area of the future plant room will have a headroom of about 5m.

Appendix 附錄

1. Development Proposal (For Relocated Soy Sauce Factory Portion)

☑ Transport-related facilities 與運輸有關的設施

☑ parking spaces 停車位 (please specify type(s) and number(s)) (請註明種類及數目)

Private Car Parking Spaces 私家車車位	12
Motorcycle Parking Spaces 電單車車位	1
Light Goods Vehicle Parking Spaces 輕型貨車泊車位	
Medium Goods Vehicle Parking Spaces 中型貨車泊車位	
Heavy Goods Vehicle Parking Spaces 重型貨車泊車位	
Others (Please Specify) 其他 (請列明)	

☑ loading/unloading spaces 上落客貨車位 (please specify type(s) and number(s)) (請註明種類及數目)

Taxi Spaces 的士車位	
Coach Spaces 旅遊巴車位	
Light Goods Vehicle Spaces 輕型貨車車位	
Medium Goods Vehicle Spaces 中型貨車車位	16 (Goods Vehicle)
Heavy Goods Vehicle Spaces 重型貨車車位	1 (Container Vehicle)
Others (Please Specify) 其他 (請列明)	

☐ other transport-related facilities 其他與運輸有關的設施 (please specify type(s) and number(s)) (請註明種類及數目)

Use(s) of different floors (if applicable) 各樓層的用途(如適用)

[Block number] [座數]	[Floor(s)] [層數]	[Proposed use(s)] [擬議用途]
N/A		

Proposed use(s) of uncovered area (if any) 露天地方(倘有)的擬議用途

N/A

Any vehicular access to the site? 是否有車路通往地盤?

Yes 是 ☑ There is an existing access. (please indicate the street name, where appropriate)
有一條現有車路。(請註明道路名稱(如適用))
Castle Peak Road - Tam Mi Section

☐ There is a proposed access. (please illustrate on plan and specify the width)
有一條擬議車路。(請在圖則顯示，並註明車路的闊度)

No 否 ☐

For Development involving columbarium use, please complete the table in the Annex to this Appendix.
如發展涉及靈灰安置所用途，請填妥於此附件後附錄的表格。

2. Impacts of Development Proposal 擬議發展計劃的影響

If necessary, please use separate sheets to indicate the proposed measures to minimise possible adverse impacts or give justifications/reasons for not providing such measures
如需要的話，請另頁註明可盡量減少可能出現不良影響的措施，否則請提供理據/理由。

Does the development proposal involve alteration of existing building? 擬議發展計劃是否包括現有建築物的改動?	Yes 是	☐ Please provide details 請提供詳情 …… …… ……
	No 否	☑
Does the development proposal involve the operation on the right? 擬議發展是否涉及右列的工程?	Yes 是	☑ (Please indicate on site plan the boundary of concerned land/pond(s), and particulars of stream diversion, the extent of filling of land/pond(s) and/or excavation of land) (請用地盤平面圖顯示有關土地／池塘界線，以及河道改道、填塘、填土及／或挖土的細節及/或範圍) ☐ Diversion of stream 河道改道 ☐ Filling of pond 填塘 Area of filling 填塘面積 …… sq.m 平方米 ☐About 約 Depth of filling 填塘深度 …… m 米 ☐About 約 ☐ Filling of land 填土 Area of filling 填土面積 …… sq.m 平方米 ☐About 約 Depth of filling 填土厚度 …… m 米 ☐About 約 ☑ Excavation of land 挖土 Area of excavation 挖土面積 24,400 sq.m 平方米 ☐About 約 Depth of excavation 挖土深度 7.5 m 米 ☑About 約
	No 否	☐

Would the development proposal cause any adverse impacts?
擬議發展計劃會否造成不良影響？

Sewerage		

Please state measure(s) to minimise the impact(s). For tree felling, please state the number, diameter at breast height and species of the affected trees (if possible)
請註明盡量減少影響的措施。如涉及砍伐樹木，請說明受影響樹木的數目、及胸高度的樹幹直徑及品種(倘可)

Please refer to Appendices of the attached Planning Statement.
……
……
……
……
……

For Developments involving Columbarium Use, please also complete the following:
如發展涉及靈灰安置所用途，請另外填妥以下資料

Ash interment capacity 骨灰安放容量@

Maximum number of sets of ashes that may be interred in the niches
在龕位內最多可安放骨灰的數量 _____

Maximum number of sets of ashes that may be interred other than in niches
在非龕位的範圍內最多可安放骨灰的數量 _____

Total number of niches 龕位總數 _____

Total number of single niches
單人龕位總數 _____

Number of single niches (sold and occupied)
單人龕位數目 (已售並佔用) _____

Number of single niches (sold but unoccupied)
單人龕位數目 (已售但未佔用) _____

Number of single niches (residual for sale)
單人龕位數目 (待售) _____

Total number of double niches
雙人龕位總數 _____

Number of double niches (sold and fully occupied)
雙人龕位數目 (已售並全部佔用) _____

Number of double niches (sold and partially occupied)
雙人龕位數目 (已售並部分佔用) _____

Number of double niches (sold but unoccupied)
雙人龕位數目 (已售但未佔用) _____

Number of double niches (residual for sale)
雙人龕位數目 (待售) _____

Total no. of niches other than single or double niches (please specify type)
除單人及雙人龕位外的其他龕位總數 (請列明類別) _____

Number. of niches (sold and fully occupied)
龕位數目 (已售並全部佔用) _____

Number of niches (sold and partially occupied)
龕位數目 (已售並部分佔用) _____

Number of niches (sold but unoccupied)
龕位數目 (已售但未佔用) _____

Number of niches (residual for sale)
龕位數目 (待售) _____

Proposed operating hours 擬議營運時間 _____

_____

@ Ash interment capacity in relation to a columbarium means –
就靈灰安置所而言，骨灰安放容量指：
- the maximum number of containers of ashes that may be interred in each niche in the columbarium;
每個龕位內可安放的骨灰容器的最高數目;
- the maximum number of sets of ashes that may be interred other than in niches in any area in the columbarium; and
在該靈灰安置所並非龕位的範圍內，總共最多可安放多少份骨灰；以及
- the total number of sets of ashes that may be interred in the columbarium.
在該骨灰安置所內，總共最多可安放多少份骨灰。

Gist of Application 申請摘要

(Please provide details in both English and Chinese as far as possible. This part will be circulated to relevant consultees, uploaded to the Town Planning Board's Website for browsing and free downloading by the public and available at the Planning Enquiry Counters of the Planning Department for general information.)
(請盡量以英文及中文填寫。此部分將會發送予相關諮詢人士、上載至城市規劃委員會網頁供公眾免費瀏覽及下載及於規劃署規劃資料查詢處供一般參閱。)

EXECUTIVE SUMMARY

INTRODUCTION

This rezoning application is submitted to the Town Planning Board (the TPB) for rezoning the "Industrial (Group D)" ("I(D)"), "Open Storage" ("OS") and 'Road' zones to a "Residential (Group E)" ("R(E)") zone or an alternative option with incorporation of tailor-made "Other Specified Use" annotated "Industrial" land-use zoning if deem appropriate by the Town Planning Board on the Draft Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9, in support of a comprehensive development at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D.107 and adjoining Government Land, West of Castle Peak Road – Tam Mi, Yuen Long (hereafter referred to as the "Application Site") under Section 12A (S12A) of the Town Planning Ordinance (the Ordinance) (CAP. 131).

PLANNING CONTEXT

Changing National and Strategic Planning Context in the Territory

Promulgated by the State Council in February 2019, the Outline Development Plan for the Guangdong-Hong Kong-Macao Greater Bay Area (GBA) clearly states that the need to develop GBA and a world-class city cluster, and foster closer co-operation between the Mainland, Hong Kong and Macao. The National 14th Five-Year Plan promulgated by the State Council in March 2021 also expressly supports Hong Kong to enhance its competitive advantages and better integrate into the overall development of the country. In particular, the National 14th Five-Year Plan supports the positioning of Hong Kong's development, inter alia, into an international centre for Innovation & Technology (I&T) and states that Hong Kong should develop towards high-end and high value-added service industries.

Based on the above context, the Northern Metropolis Development Strategy is formulated by the Government in October 2021 on the basis of the Hong Kong 2030+. The Northern Metropolis Action Agenda (NMAA) was then issued by the Government on Oct 2023 to outline the key development vision and framework of the Northern Metropolis.

According to the NMAA, the Northern Metropolis is divided into four major development zones. The Applicant Site is situated within the Innovation and Technology Zone in which San Tin Technopole is the major focus of development. The San Tin Technopole contains a balanced and diversified land-uses pattern, which allows it to not only act as the core of industrial development in the Northern Metropolis, but also become a liveable town with comprehensive community facilities.

Taking forward the implementation of San Tin Technopole, the draft OZP in support of the San Tin Technopole (i.e. San Tin and Lok Ma Chau area) was gazetted in January 2024. Subsequently, the plan-making procedures including hearing of representations was completed in September 2024. The approved San Tin Technopole OZP No. S/STT/2 was then gazetted to provide a proper land-use framework, broad principles of development and development control for future developments.

According to the approved San Tin Technopole OZP, it is estimated that the total planned population would be about 165,600 persons. Compared to the planned 54,000 residential units under the San Tin Technopole, it is foreseeable that there will be a huge gap between the housing supply and demand to be generated by the 217,000 families of the working population. As such, supporting residential developments to accommodate the increasing employment population are very much required in order to achieve home-job balance so to reduce the need for people to commute between their homes and working places.

Changing Development Circumstances in Yuen Long

The planning of Yuen Long has been continuously evolving over time. Initially with nodal developments around Yuen Long Kau Hui and Yuen Long San Hui, Yuen Long New Town had then further developed around the transit-oriented, high-rise and high-density mixed-use comprehensive developments at the stations along Tuen Ma Line. In recent years, the periphery of the Yuen Long New Town has been extended northwards and eastwards towards the areas near Castle Peak Road. A completed large-scale residential cluster just to the southeast of the Application Site across San Tin Highway, where Park Yoho is situated, is one example. The area where the Application Site is located can be considered as a logical extension of Yuen Long New Town.

With the implementation of the NOL and Northern Metropolis Highway in full speed, it gives rise to the opportunity of releasing the development potential of valuable land resources at locations close to future stations of the NOL. This is also evident by the Government's action to develop the Sha Po Public Housing Development, which is located to the immediate east of the planned Au Tau Station. The public housing development will have a domestic PR of 6.5 and a BH of 185mPD[1], which optimises the development potential of the site by developing high-density-high-rise development. Since the Application Site is located about 150m to the immediate west of the planned Au Tau Station, the development potential of the Application Site should be reviewed taking into account this changing local planning context.

[1] With reference to TPB Paper No. 10916 for consideration by the Town Planning Board on 1.9.2023.

Changing Considerations for Wetland Buffer Area for Increasing Housing Supply

Located at the fringe of the Wetland Buffer Area (WBA) as set out under the Town Planning Board Guidelines for Application for Developments within Deep Bay Area under Section 16 of the Town Planning Ordinance (TPB PG-No.12C), the Application Site is very far away (at least 3km) from Deep Bay. Also, majority of the Application Site is currently dominated by an existing soy sauce factory and a container storage yard, which is of low to very low ecological value. Due to its disturbed nature (i.e. wasteland and developed area), the existing environment within and near the Application Site has endured a certain level of disturbance from human activities in the vicinity.

In view of the opportunities as given rise by the Northern Metropolis which aims to achieve "Urban-Rural Integration and Co-existence of Development and Conservation", the development of wetlands and wetland buffer areas will be dealt with under the Northern Metropolis Development Strategy as mentioned in the 2021 and 2022 Policy Address. The Government will also review the Planning Guidelines relating to the WBA on the premise of balancing the needs for conservation and increase of housing land supply. The above shows the Government's intention to further optimise the development potential of land resources in WBA with a view to enhancing housing supply.

Optimise Spatial Planning with a Compatible Modernised Industrial Development

According to HK2030+, the community shall contribute to improve urban microclimate and facilitate retrofitting of ageing neighbourhoods in order to refine the built fabric of the city through optimising spatial planning and design. The Government has also been advocating re-industrialisation (also known as Industry 4.0) which aims to revitalise and modernise traditional industries since the initiative was first released in the 2016 Policy Address. Taking into account the latest policy directives, with active coordination with the operator of the existing soy sauce factory on-site, the Applicant now proposes to optimise the spatial planning of the Application Site by relocating the factory to the southern tip with a further distance away from Deep Bay. The soy sauce factory will also be upgraded and modernised into a more environmental-friendly industrial building, which renders an opportunity for the Applicant to re-visit the development potential for the remaining area within the Application Site for development of a compatible residential development.

INDICATIVE DEVELOPMENT SCHEME

The Proposed Development could be divided into 3 portions, namely the Residential Portion, the Relocated Soy Sauce Factory Portion and the Reserved School Site. For the Residential Portion, the development site area is about 46,501m^2, with a total domestic GFA of about 115,942m^2. The Proposed Development consists of 11 residential towers with a building height ranging from 15 to 29 storeys (i.e. 61.5mPD to 115mPD) above a carpark / E&M basement, offering a total of 3,115 residential units.

The Relocated Soy Sauce Factory Portion of about 27,459m^2, located at the southern part of the Application Site, would provide a total non-domestic GFA for Relocated Soy Sauce Factory as 13,700m^2 and a maximum building height of not more than 15mPD for the future operation of a new, modernized soy sauce factory.

To cater for the potential educational needs of the area's future population, a site (of site area of 6,200m^2) has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

DEVELOPMENT JUSTIFICATION AND PLANNING GAINS

The Proposed Development is fully supported by the following justifications and planning merits:

- The subject rezoning application is complementary to the latest strategic planning framework;

- The subject rezoning application can harness the enhanced infrastructural capacity brought by the planned traffic infrastructure and unleash the development potential of the Application Site;

- The subject rezoning application is in line with the Government's endeavours in enhancing housing land supply;

- The Proposed Development can serve as an anchor housing development to alleviate the acute housing shortage;

- The development intensity of the Proposed Development is compatible with the changing land use planning context in the vicinity;

- The subject rezoning application is in line with the government's intention for releasing development potential in WBA;

- The subject rezoning application respects the planning requirements under TPB-PG No. 12C;

- The subject rezoning application echoes with the Government's policy directive of promoting re-industrialization (as known as Industry 4.0) and will great improvement to the existing environment through comprehensive residential development and relocation of the existing soy sauce factory within the Application Site;

- The Proposed Development is carefully formulated with planning gains and design merits;

- Largely secured land holding status with consensus with soy sauce factory owner on the rezoning scheme can warrant timely implementation of the Proposed Development; and

- There is no insurmountable problem due to the Proposed Development from technical aspects.

Based on the above justifications and merits, the TPB is cordially invited to consider this rezoning application favourably.

行政摘要

(聲明：此中文譯本僅供參考，如中文譯文和英文原文有差異，應以英文為準。)

申請簡介

根據城市規劃條例第 12A 條 (第 131 章)，申請人現向城市規劃委員會(下稱「城規會」)遞交改劃申請(下稱「本申請」)，擬議對南生圍分區計劃大綱草圖編號 S/YL-NSW/9 (下稱「大綱圖」)作出修訂，將位於元朗青山公路 – 潭尾段以西丈量約份第 107 約地段第 1910 號餘段(部分)及第 1743 號 C 分段餘段(部分)和毗鄰政府土地(下稱「申請地點」)的土地用途，由「工業 (丁類)」、「露天貯物」及「道路」改劃為「住宅(戊類)」地帶，或採用另一種方案，即在城規會認為合適的情況下，納入特別定制的「其他指定用途」註明「工業」地帶以作綜合發展用途。

規劃背景

<u>國家和策略性規劃情況的轉變</u>

在 2019 年 2 月，國務院發布《粵港澳大灣區發展規劃綱要》，當中明確表明將需要發展大灣區，以促進內地、香港和澳門的緊密合作。其後，在 2021 年 3 月頒布的《中華人民共和國國民經濟和社會發展第十四個五年規劃和 2035 年遠景目標綱要》，文件上也明確支持香港提升競爭優勢，使香港更全面地融入國家發展。其中一個主要的發展重點，則表示香港的發展定位可成為國際創新科技中心，並提出香港需要發展高端、高增值服務。

基於上述背景，香港特別行政區政府於 2021 年 10 月發布以《香港 2030+》為基礎的《北部都會區發展策略》。政府隨後於 2023 年 10 月發布了北部都會區行動綱領以概述北部都會區的主要發展願景和框架。

根據北部都會區行動綱領，北部都會區分為四大發展區。申請地點位於創新科技地帶內，而新田科技城是該地帶內的主要發展重點。新田科技城擁有均衡及多元化的土地用途格局，使其不僅能成為北部都會區的產業發展核心，更能成為一個社區設施完善的宜居小鎮。

為推動新田科技城的落實，支持新田科技城(即新田及落馬洲地區)的

大綱草圖已於 2024 年 1 月刊憲。有關制圖程序(包括就有關申述進行聆聽會)亦於 2024 年 9 月完成。新田科技城分區計劃大綱核准圖編號 S/STT/2 隨後刊憲，並為未來的發展提供適當的土地用途架構、廣泛發展原則和發展監管。

根據已核准的新田科技城分區計劃大綱圖，新田科技城的預計規劃總人口約 165,600 人。與新田科技城規劃的 54,000 個住宅單位相比，其 217,000 個就業人口的住宅需求將與其住宅供應產生巨大差距。因此，我們需要額外的住宅發展以容納不斷增加的就業人口，以實現職住平衡，從而減少人們在居住地與工作地點之間通勤的需要。

元朗及周邊環境的轉變

元朗的規劃隨著時間的推移而不斷演變。元朗新市鎮最初以元朗舊墟和元朗新墟為節點發展，後來進一步沿屯馬線沿線車站發展公共運輸導向、高層及高密度的綜合發展項目。近年來，元朗新市鎮的外圍已經不斷向北面和東面延伸至近青山公路的地區。一個位於申請地點東南，橫跨新田公路，並已竣工的大型住宅群(即 Park Yoho)就是一個好例子。申請地點所在的地區因此可以被視為元朗新市鎮的延伸。

隨著北環綫和北都高路的全面推進，北環綫未來車站附近的珍貴土地將迎來釋放發展潛力的機會。政府位於規劃中的凹頭站以東的沙埔公營房屋發展也證明了這一點。該公營房屋發展的住用地積比為 6.5，建築物高度為不多於主水平基準以上 185 米，此高樓層高密度的發展能夠優化該地塊的發展潛力。由於申請地點位於規劃中的凹頭站以西約 150m，因此申請地點的發展潛力應根據規劃環境的變化重新檢視。

考慮利用「濕地緩衝區」內合適的地方，增加房屋土地供應

根據規劃指引編號 12C，申請地點位於「濕地緩衝區」的邊陲，遠離后海灣至少有 3 公里的距離。此外，大部分的申請地點目前用作醬油廠和貨櫃場，生態價值屬低至極低。由於其受干擾的性質(即荒地和已開發地區)，申請地點及其附近的現有環境已受附近人類活動一定程度的干擾。

《北部都會區發展策略》當中提到實現「城鄉融合、發展與保育並存」的發展理念，而行政長官亦在 2021 及 2022 年施政報告中提到「濕地和濕地緩衝區的發展事宜則會在《北部都會區發展策略》中處理」。政府亦將會在平衡保育與增加房屋土地供應的前提下，檢討有關『濕地緩衝區』的規劃指引。這清楚地表明政府有意進一步善用位於「濕地緩衝區」的土地資源及發展潛力，以增加房屋供應。

藉著「再工業化」的契機，加以配合發展情況

《香港 2030+》提出，香港社會應致力於改善城市微氣候，促進老化社區的改造，並透過優化空間規劃設計，完善城市建築脈絡。政府在《2016年施政報告》中首次提出「再工業化」的政策(亦可稱為「工業4.0」)，目標是復興及現代化傳統工業。透過與現有醬園擁有人的積極協商，並得到其初步同意，申請人現擬議搬遷醬園至申請地點內的南面部分，以優化申請地點的空間規劃。將醬園重置到南端用地後，醬園的廠房將升級及現代化，並採用環保的生產模式以大大改善當地的環境，並有效釋放申請範圍內其它地方的發展潛力以作合適的房屋發展。

擬議發展計劃

擬議發展可分爲三個部分。住宅部分的發展面積約46,501平方米，擬議發展的住用建築面積約為115,942平方米。擬議發展包括11棟住宅樓宇，建築物樓層層高15至29層(建築物高度為不多於主水平基準以上61.5米至115米)，並設有一層地庫，合共提供3,115個住宅單位。

申請地點內的南面部分為重置醬園，面積約27,459平方米，將會提供不多於13,700平方米的非住用總樓面面積及建築物高度為不多於主水平基準以上15米，作全新及現代化的醬園。

為滿足未來區內人口對教育設施的潛在需求，擬議發展已於申請地點預留面積約6,200平方米作小學用途。若預留地塊發展為教育用途並由私人機構實施，則未來營運者須依現行政策向相關政府部門提出所需申請及登記以獲批准。

發展理據及規劃增益

以下為支持是次改劃申請要發展理據及規劃增益：

- 是次改劃申請能配合最新的策略性規劃框架；
- 是次改劃申請可以透過已規劃的基建設施所增強的基建設施能力，釋放申請地點的發展潛力；

- 是次修訂圖則申請與政府現行地盡其用以增加土地房屋供應的政策相符；
- 擬議發展可以紓緩目前房屋嚴重短缺問題；
- 擬議發展的密度與附近改變中的土地規劃互相協調；
- 擬議發展符合政府釋放位於「濕地緩衝區」內的土地發展潛力的相關意向；
- 是次修訂圖則申請符合城市規劃委員會規劃指引編號 12C 的要求；
- 是次修訂圖則申請與政府所推動「再工業化」的政策(亦可稱為「工業 4.0」)相符，亦將會透過綜合住宅發展及重置醬園，大大改善現時申請地點的環境；
- 擬議發展提供設計優點和規劃增益；
- 申請人已獲得申請地點內大部份私人土地的業權，並已取得醬園擁有人的同意，有利項目及時落成；及
- 擬議發展在各個技術方面是可行的。

基於以上發展理據，懇請城規會對本修訂圖則申請予以贊同。

1 INTRODUCTION

1.1 Introduction

1.1.1 This rezoning application is submitted to the Town Planning Board (the Board) for rezoning the "Industrial (Group D)" ("I(D)"), "Open Storage" ("OS") and 'Road' zones to a "Residential (Group E)" ("R(E)") zone or an alternative option with incorporation of a tailor-made "Other Specified Use" annotated "Industrial" zone if deem appropriate by the Town Planning Board on the Draft Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9, in support of a comprehensive development at Lots 1910 RP (Part) and 1743 S.C RP (Part) and adjoining Government Land, West of Castle Peak Road – Tam Mei, Yuen Long (hereafter referred to as the "Application Site") under Section 12A (S12A) of the Town Planning Ordinance (the Ordinance) (CAP. 131) (see **Figure 1.1**).

1.2 Opportunities Arising from the Changing Planning Context

Changing National and Strategic Planning Context in the Territory

1.2.1 Promulgated by the State Council in February 2019, the Outline Development Plan for the Guangdong-Hong Kong-Macao Greater Bay Area (GBA) clearly states that the need to develop GBA and a world-class city cluster, and foster closer co-operation between the Mainland, Hong Kong and Macao. The National 14th Five-Year Plan promulgated by the State Council in March 2021 also expressly supports Hong Kong to enhance its competitive advantages and better integrate into the overall development of the country. In particular, the National 14th Five-Year Plan supports the positioning of Hong Kong's development, inter alia, into an international centre for Innovation & Technology (I&T) and states that Hong Kong should develop towards high-end and high value-added service industries.

1.2.2 Based on the above context, the Northern Metropolis Development Strategy is formulated by the Government in October 2021 on the basis of the Hong Kong 2030+. The Northern Metropolis Action Agenda (NMAA) was then issued by the Government on Oct 2023 to outline the key development vision and framework of the Northern Metropolis.

llewelyn davies	Title: Extract from Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9	Checked	DH	Drawn PW
		Rev	0	Date Feb 2025
		Scale NA		Figure 1.1

1.2.3 According to the NMAA, the Government aims to develop the Northern Metropolis into a metropolitan area for people to live, work and travel. It is expected that there will be ample opportunities for housing, community facilities, technology development and other industries in the region. As a result, the Northern Metropolis will re-structure the overall spatial development framework of Hong Kong and become the future economic engine and important employment hub serving Hong Kong as well as Shenzhen. It will become a "new International I&T city" that contains unique metropolitan landscape marked with "Urban-Rural Integration and Co-existence of Development and Conservation" and will be comparable to the Harbour Metropolis in the south that positioned as an International Financial Centre (i.e. Hong Kong's traditional business area). The current suburban characteristic of Northern New Territories will be drastically transformed into an urban context in the future.

1.2.4 According to the NMAA, the Northern Metropolis is divided into four major development zones. The Applicant Site is situated within the Innovation and Technology Zone in which San Tin Technopole is the major focus of development. The San Tin Technopole contains balanced and diversified land-uses pattern, which allows it to not only act as the core of industrial development in the Northern Metropolis, but also become a liveable town with comprehensive community facilities.

1.2.5 Taking forward the implementation of San Tin Technopole, the draft OZP in support of the San Tin Technopole (i.e. San Tin and Lok Ma Chau area) was gazetted in January 2024. Subsequently, the plan-making procedures including hearing of representations was completed in September 2024. The approved San Tin Technopole OZP No. S/STT/2 was then gazetted to provide a proper land-use framework, broad principles of development and development control for future developments.

1.2.6 The San Tin Technopole is planned to comprise mainly an I&T Park and a San Tin Town Centre. According to the approved San Tin Technopole OZP, the area will be one of the major land sources for the total of 3,370 ha developable land estimated to be available in 10 years from 2024-2025 to 2033-2034. Together with the HSITP at the Loop, the Technopole will supply about 300 ha of I&T land, which is capable of accommodating a total gross floor area (GFA) of about 7 million m^2. The portion within the San Tin Lok Ma Chau area is planned to have an area of about 210 ha and a total GFA of about 5.7 million m^2 with a view to creating a critical mass to

foster I&T advancement, driving the development of an international I&T hub and deepening the I&T collaboration with Shenzhen and the world.

1.2.7 The planned 217,000 employment opportunities in San Tin Technopole will generate huge demand for housing units. Like other major cities, Hong Kong currently has a heavy vehicular and pedestrian flow commuting back and forth from major employment hubs. The Hong Kong Government is committed to shorten the commuting time for the public between their living and working spaces and so as to reduce the need for daily travels as well as the resultant traffic congestion in the road network. One of the best solutions is to plan the new development areas with balanced living and work opportunities and so that the people do not have to travel across the territory on a daily basis.

1.2.8 According to the approved San Tin Technopole OZP, it is estimated that the total planned population would be about 165,600 persons. Compared to the planned 54,000 residential units under the San Tin Technopole, it is foreseeable that there will be a huge gap between the housing supply and demand to be generated by the 217,000 families of the working population. As such, supporting residential developments to accommodate the increasing employment population are very much required in order to achieve home-job balance so to reduce the need for people to commute between their homes and working places.

Changing Development Circumstances in Yuen Long

1.2.9 The planning of Yuen Long has been continuously evolving over time. Initially with nodal developments around Yuen Long Kau Hui and Yuen Long San Hui, Yuen Long New Town had then further developed around the transit-oriented, high-rise and high-density mixed-use comprehensive developments at the stations along Tuen Ma Line. In recent years, the periphery of the Yuen Long New Town has been extended northwards and eastwards towards the areas near Castle Peak Road. A completed large-scale residential cluster just to the southeast of the Application Site across San Tin Highway, where Park Yoho is situated, is one example. The area where the Application Site is located can be considered as a logical extension of Yuen Long New Town.

1.2.10 In support of the development of Northern Metropolis, the implementation of the planned Northern Link (NOL) which stretches along the majority areas under the Northern Metropolis will be expedited. The implementation of the NOL is in good progress with detailed planning and design in progress. The construction works of NOL Main Line (i.e. the section connecting Kam Sheung Road Station and the Kwu Tung Station with three intermediate stations at San Tin, Ngau Tam Mei and Au Tau) are anticipated to commence in 2025 and is expected to complete in 2034 to support the developments around San Tin Technopole, Ngau Tam Mei and Au Tau. The NOL will offer an enhanced transport choice to the residents in the vicinity, reducing the travelling time for the existing population as well as the additional population arising from the developments along the alignment of the NOL in future.

1.2.11 In regard to road traffic infrastructure, the implementation programme for the Northern Metropolis Highway, the Secretary for Transport and Logistics recently updated that the government will seek funding approval for the investigation works for the NM Highway shortly, whereas the construction works are targeted to commence by 2028. The San Tin Section of this strategic highway, which is in close proximity to the Application Site, is promulgated and scheduled for opening in or before 2036.

1.2.12 With the implementation of the NOL and Northern Metropolis Highway in full speed, it gives rise to the opportunity of releasing the development potential of valuable land resources at locations close to future stations of the NOL. This is also evident by the Government's action to develop the Sha Po Public Housing Development, which is located to the immediate east of the planned Au Tau Station. The public housing development is will have a domestic PR of 6.5 and a BH of 185mPD[2], which optimises the development potential of the site by developing high-density-high-rise development. Since the Application Site is located about 150m to the immediate west of the planned Au Tau Station, the development potential of the Application Site should be reviewed taking into account this changing local planning context.

[2] With reference to TPB Paper No. 10916 for consideration by the Town Planning Board on 1.9.2023.

Changing Considerations for Wetland Buffer Area for Increasing Housing Supply

1.2.13 Located at the fringe of the Wetland Buffer Area (WBA) as set out under the Town Planning Board Guidelines for Application for Developments within Deep Bay Area under Section 16 of the Town Planning Ordinance (TPB PG-No.12C), the Application Site is very far away (at least 3km) from Deep Bay. Also, majority of the Application Site is currently dominated by an existing soy sauce factory and a container storage yard, which is of low to very low ecological value. Due to its disturbed nature (i.e. wasteland and developed area), the existing environment within and near the Application Site has endured a certain level of disturbance from human activities in the vicinity. In fact, the southern part of the Application Site was the subject of a previous S12A rezoning approval (Application No. Y/YL-NSW/3) for a proposed shopping mall cum hotel development, which was approved on 18 March 2016.

1.2.14 Since the last approval in 2016, however, there has been a continuous surge in demand for housing supply and the previously proposed hotel and shopping mall is no longer appropriate. According to the latest Long Term Housing Strategy (LTHS) – Annual Progress Report 2024 published in October 2024, the projected total housing supply target for the 10-year period from Year 2025-26 to 2034-35 is 440,000 units. The supply of spade-ready sites for private housing should also be stabilised in order to provide about 80,000 private housing units in the next five years as mentioned in the 2024 Policy Address.

1.2.15 In view of the opportunities as given rise by the Northern Metropolis which aims to achieve "Urban-Rural Integration and Co-existence of Development and Conservation", the development of wetlands and wetland buffer areas will be dealt with under the Northern Metropolis Development Strategy as mentioned in the 2021 and 2022 Policy Address. The Government will also review the Planning Guidelines relating to the WBA on the premise of balancing the needs for conservation and increase of housing land supply. The above shows the Government's intention to further optimise the development potential of land resources in WBA with a view to enhancing housing supply.

1.2.16 Under the Northern Metropolis Strategy promulgated in 2021, the Government proposed to establish a Wetland Conservation Parks System with a view to conserving the Deep Bay wetlands on one hand and to achieve co-existence of conservation and development in parallel. The development of the system is considered feasible to enhance the wetland ecosystem as well as the Government's intention to provide environmental capacity for supporting development of the Northern Metropolis.

1.2.17 In formulating the subject development proposal under the current rezoning application, one of the primary planning objectives is to contribute to the increase in the housing supply to meet the medium- to long-term land requirements. With a target completion year of 2031, this rezoning application can contribute to improve our housing supply by way of consolidating underutilised land resources for comprehensive urbanisation. The proposed development will not encroach onto any of the proposed Wetland Conservation Parks and will therefore induce no adverse impact to the proposed Wetland Conservation Parks System.

Optimise Spatial Planning with a Compatible Modernised Industrial Development

1.2.18 According to HK2030+, the community shall contribute to improve urban microclimate and facilitate retrofitting of ageing neighbourhoods in order to refine the built fabric of the city through optimising spatial planning and design. The Government has also been advocating re-industrialisation (also known as Industry 4.0) which aims to revitalise and modernise traditional industries since the initiative was first released in the 2016 Policy Address. Taking into account the latest policy directives, with active coordination with the operator of the existing soy sauce factory on-site, the Applicant now proposes to optimise the spatial planning of the Application Site by relocating the factory to the southern tip with a further distance away from Deep Bay. The soy sauce factory will also be upgraded and modernised into a more environmental-friendly industrial building, which renders an opportunity for the Applicant to re-visit the development potential for the remaining area within the Application Site for development of a compatible residential development.

1.2.19 Further elaborations on the rezoning considerations will be detailed in Section 3.

1.3 Purpose of Submission

1.3.1 Taking into account the Northern Metropolis Development Strategy and the rapid changes of planning and development context surrounding the Application Site, the Applicant intends to seize this unique opportunity to rezone the Application Site and unleash its development potential for a medium-density residential use and a new, clean and modernised soy sauce factory use.

1.4 The Rezoning Proposal

1.4.1 The Applicant intends primarily to phase out the existing old industrial / brownfield uses from the Application Site to make way for residential, education and modern factory uses.

1.4.2 Under the redevelopment scheme, there will be 3 major development portions within the Application Site namely:

1. Residential Portion (with a total maximum domestic GFA of about 115,942m^2 and a maximum building height of not more than 115mPD);

2. Relocated Soy Sauce Factory Portion (with a maximum GFA of not more than 13,700m^2 and a maximum building height of not more than 15m); and

3. A site of site area of 6,200m^2 has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

1.4.3 As agreed with the respective land owner, the Applicant proposes to redevelop the existing soy sauce factory site for residential use, which is fully compatible with the proposed private housing development on the adjacent "OU(CDWRA)" site under separate planning application (i.e. Y/YL-NSW/8) and the nearby planned Sha Po public housing development. Under the redevelopment proposal, the existing soy sauce factory will be relocated to the southern tip of the Application Site where a new, clean and modernised factory will be established. The proposed relocation of the key environmental constraint of the Application Site will unleash the development potential of the site and its surrounding area.

1.4.4 Various technical assessments have been prepared to substantiate that the proposed rezoning request would not result in any insurmountable problems in technical terms and are enclosed with this Planning Statement.

1.5 Report Structure

1.5.1 This planning statement includes the following sections:

Section 2:	describes and analyses the Application Site and its surroundings, reports the land status of the Application Site,
Section 3:	describes and analyses the strategic planning context;
Section 4:	depicts the proposed amendment to the concerned OZP, and the indicative rezoning proposal;
Sections 5 to 11:	summarise the key findings of various technical assessments on visual, traffic, environmental, drainage, sewerage, water supply, ecology, air ventilation and risk;
Section 12:	presents the rezoning justifications and merits of the Proposed amendments to the OZP; and
Section 13:	concludes the planning statement.

1.5.2 Detailed technical assessments and other supplementary information are attached in **Appendices A to K**.

Appendix A1	Proposed Amendments to the Plan, Notes and Explanatory Statement of the Draft Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9 (Original Option)
Appendix A2	Proposed Amendments to the Plan, Notes and Explanatory Statement of the Draft Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9 (Alternative Option)
Appendix A3	Planning Study on Proposed Land-use Zoning Boundaries (Alternative Option)
Appendix B	Landscape Design Proposal
Appendix C	Visual Impact Assessment
Appendix D	Traffic Impact Assessment
Appendix E	Environmental Assessment
Appendix F	Drainage Impact Assessment
Appendix G	Sewerage Impact Assessment

Appendix H Water Supply Impact Assessment
Appendix I Ecological Impact Assessment
Appendix J Air Ventilation Assessment
Appendix K Quantitative Risk Assessment
Appendix L Previous Responses-to-Comments

2 SITE AND DEVELOPMENT CONTEXT

2.1 Site Context

2.1.1 The Application Site is located to the west of Kam Tin, Yuen Long. It is a roadside site with Castle Peak Road – Tam Mi Section and San Tin Highway to the immediate east. It is also bounded by Pok Wai South Road and Kam Tin River, along with an associated river meander to the west. The Application Site is accessible from the Castle Peak Road – Tam Mi Section.

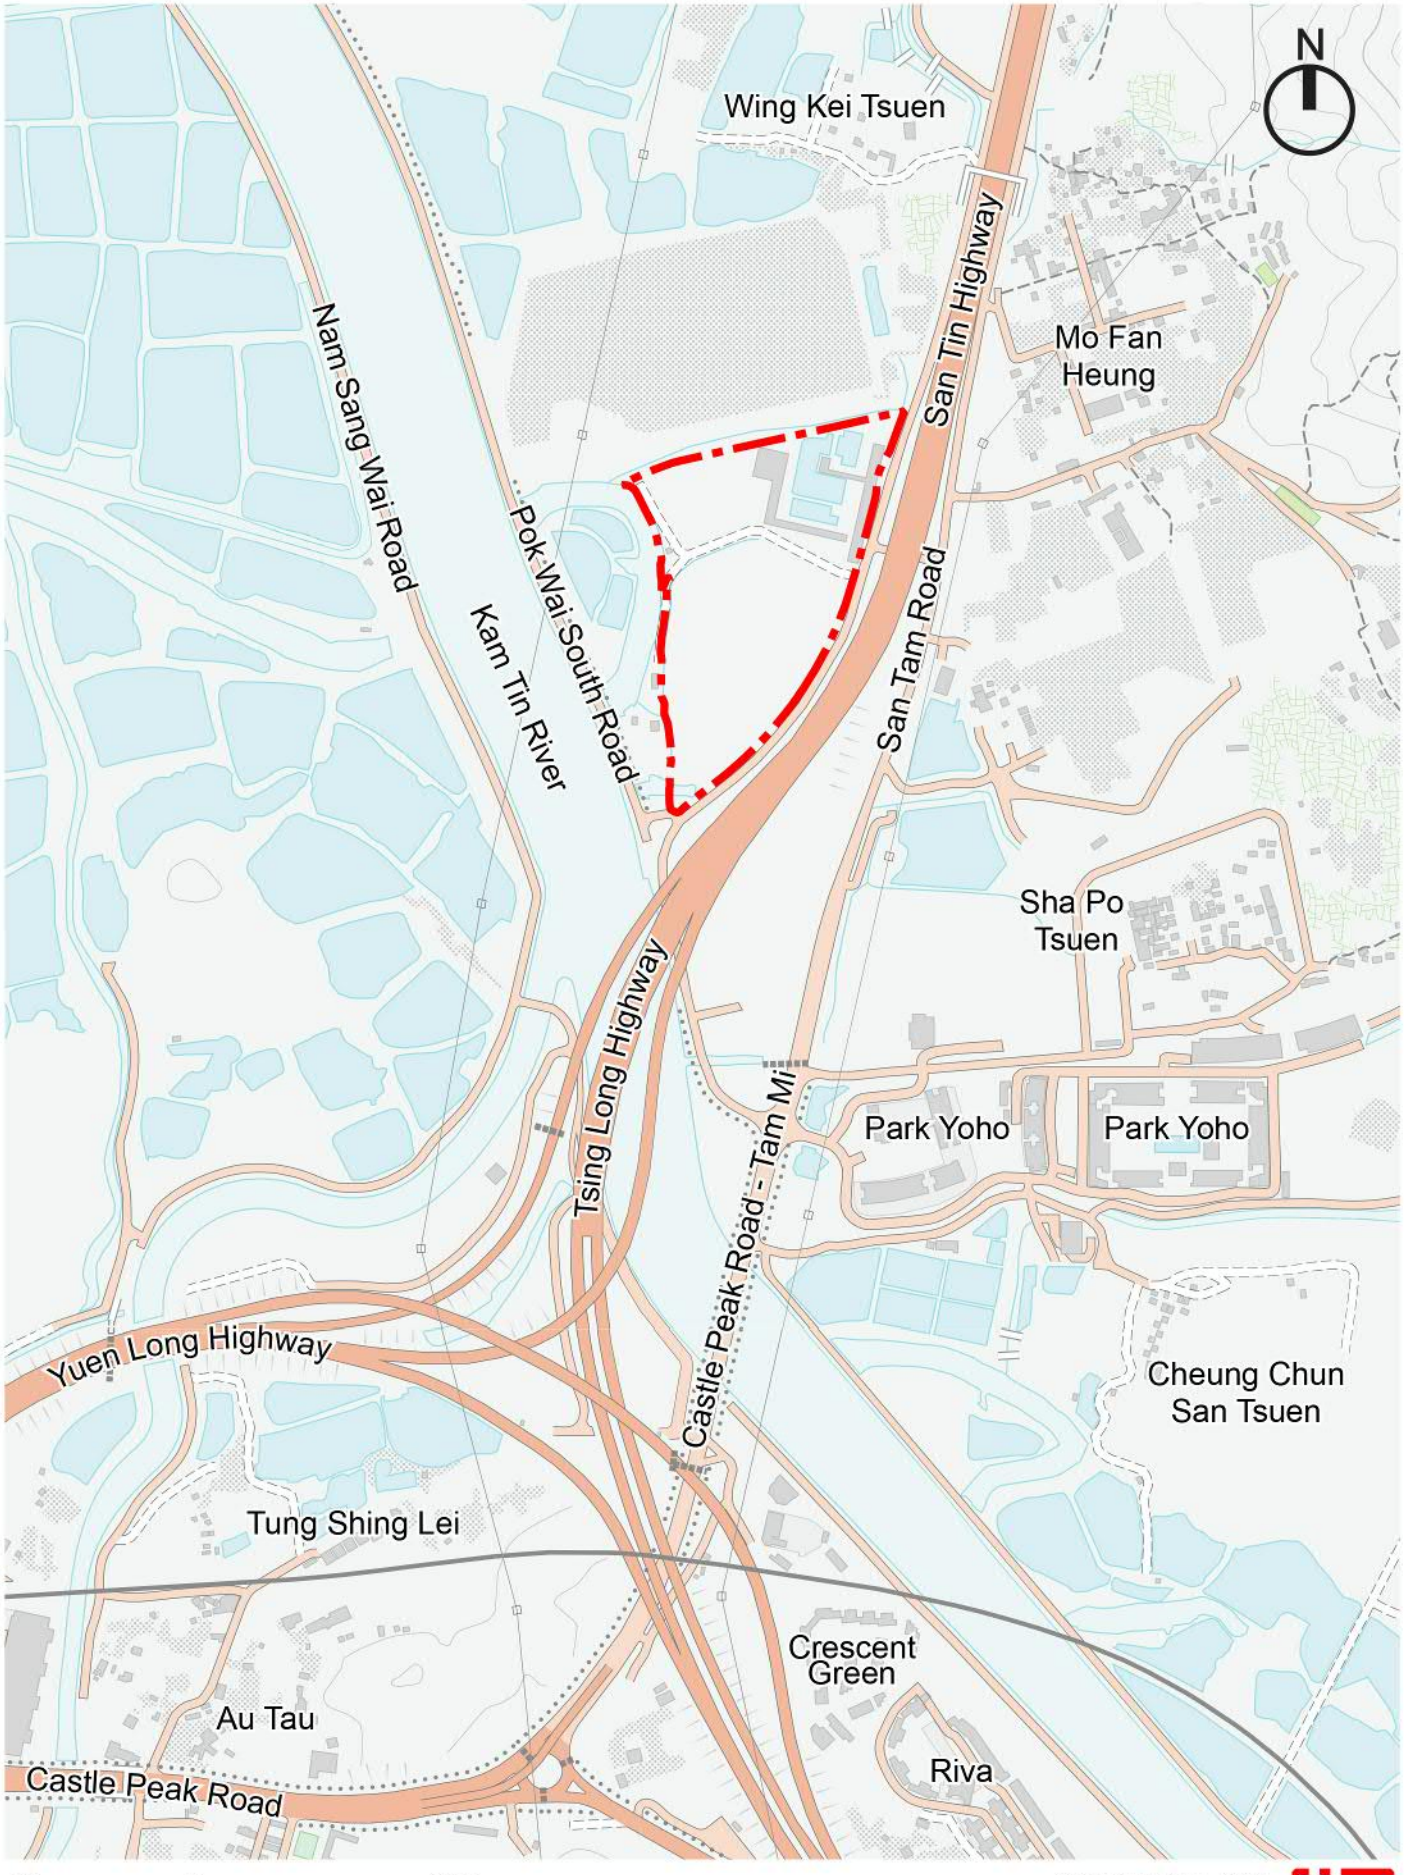
2.1.2 Served by a comprehensive transport network, the Application Site is well connected with other parts of the New Territories and the metro areas in Hong Kong. At present, the Site is within a 15-minute distance from the Tuen Ma Line – Yuen Long Station by mini-bus and will be within a walking distance of about 150m from the planned Au Tau Station of Northern Link (NOL) (see **Figures 2.1 and 2.3**).

Existing Use

2.1.3 Currently, the Application Site falls within the "I(D)" and "OS" zones. The northern part of the Application Site is zoned "I(D)", occupied by an existing soy sauce factory which is in operation, and some unused land and scattered temporary structures. The southern portion of the Application Site which falls within the "OS" zone is currently used as a temporary container storage yard.

2.1.4 The Application Site is located at the fringe of WBA and is very far away (at least 3km) from the Deep Bay. In fact, the Application Site has been paved, developed and currently occupied by the existing soy sauce factory and container storage yard with no wetland / fishpond involved. Only a very small section of narrow channel, planation and wasteland are found on-site and their existing ecological values are considered to be very low to low.

2.1.5 In formulating the Proposed Development at the Application Site, due respect has been paid to the requirements set out in the Town Planning Board Guidelines for Application for Developments within Deep Bay Area under Section 16 of the Town Planning Ordinance (TPB PG-No.12C) to ensure that no adverse ecological impact will be generated on the surrounding area. Details are discussed in the Ecological Impact Assessment enclosed in **Appendix I**.



llewelyn davies	Title: Location Plan	Checked	DH	Drawn PW
		Rev	0	Date Feb 2025
		Scale NA		Figure 2.1

Surrounding Context

2.1.6 Situated adjacent to the northeast of Yuen Long New Town, in addition to the high-density and high-rise residential developments around the Yuen Long Station, a cluster of existing development (i.e. Park Yoho), as well as planned and committed developments (including the comprehensive developments in the "Comprehensive Development Area" ("CDA") and "CDA(1)" zones, are situated in close proximity to the southeast of the Application Site. A Land Sharing Pilot Scheme (LSPS) site at Ho Chau Road about 500m southwest to the Application Site was also rezoned recently for a comprehensive public/private housing development project with a PR of about 2.16 for the private housing portion and about 4.45 for public housing portion.

2.1.7 To the east across the San Tin Highway of the Application Site is an area zoned "Other Specified Uses" annotated "Railway Reserve" which is reserved for the future NOL. According to the NOL Project Profile prepared by the MTRCL the planned Au Tau Station will be implemented about 150m to the east of the Application Site.

2.1.8 As identified under the Government's "Study on Existing Profile and Operations of Brownfield Sites in the New Territories" (the Study) released in November 2019, the Sha Po Public Housing site to the east of the Application Site is selected for public housing development. To take forward implementation of the Sha Po Public Housing development and related GIC facilities, the land-use zoning of the concerned approved Kam Tin North Outline Zoning Plan No. S/YL-KTN/11 has been rezoned as "Residential (Group A)" in January 2023. As per the OZP, the public housing development will have a domestic PR of 6.5 on top of a non-domestic PR of 0.2 and a maximum BH of 185mPD. The development will provide about 16,300 units.

2.1.9 The area to the north of the Application Site is zoned "OU(CDWRA)" with an approved planning application for a comprehensive development of an outlet mall with commercial uses (Application No. A/YL-NSW/241). It is also noted that there is another planning application (i.e. Y/YL-NSW/8) submitted to the Town Planning Board for rezoning a piece of land in support of a comprehensive development with a maximum domestic GFA of about 255,708m^2 and maximum building height of not more than 115mPD.

2.1.10 **Figure 2.2** shows the site and surrounding context of the Application Site. **Figures 2.3** and **2.4** summarise the development profile of various existing and planned developments along the alignment of the existing Tuen Ma Line and in the vicinity of the future NOL. It is evident that the area to the east of Yuen Long town where the Application Site is located can be considered as an extension of the new town, the area is gradually transforming from a sub-urban area to an urban township with development intensity and building height gradually descending towards the north across San Tin Highway, then towards the Deep Bay.

2.2 Planning Context

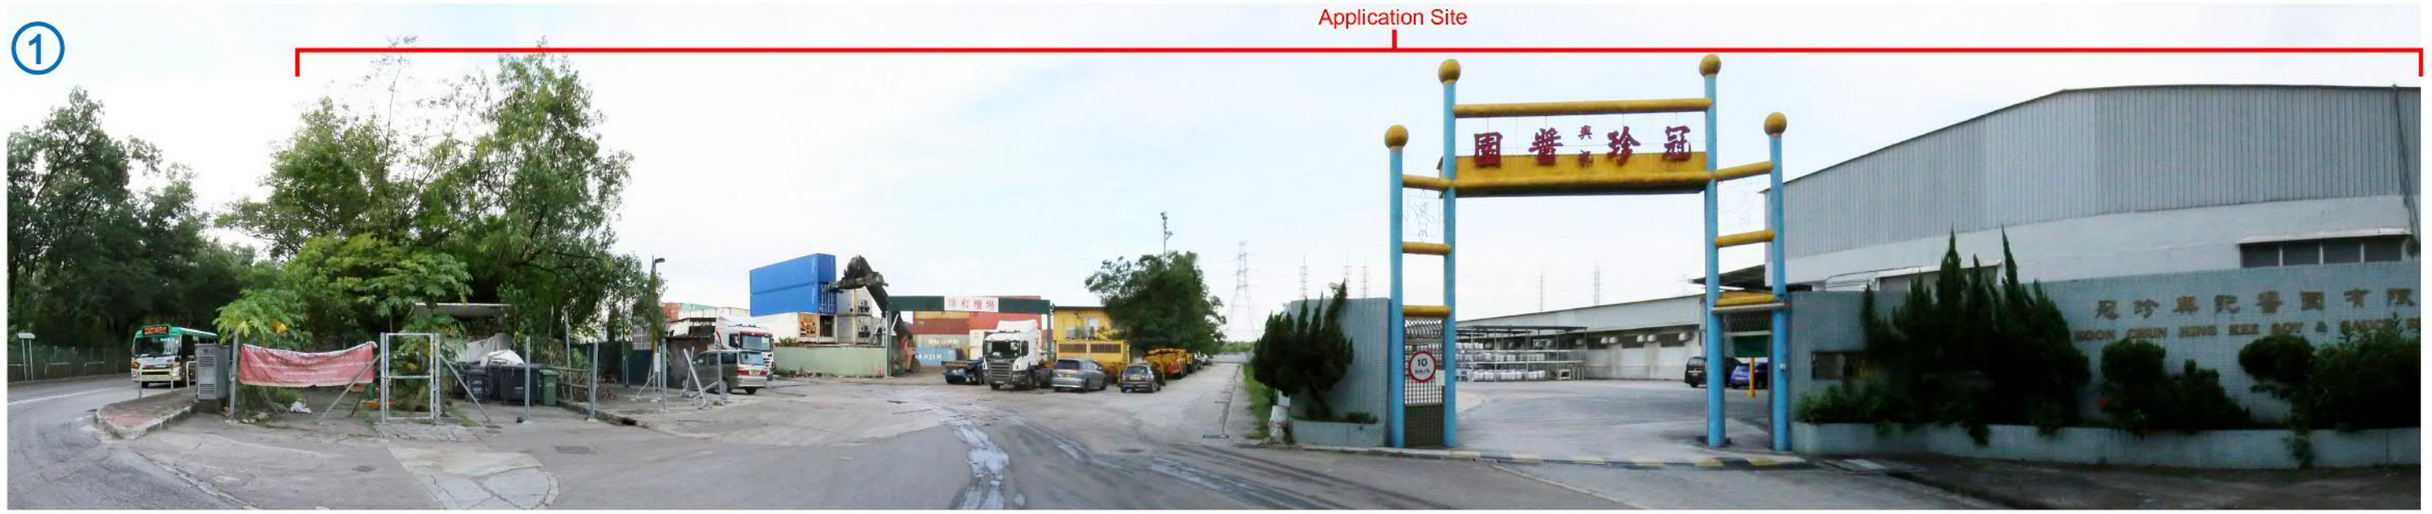
Planning Intention of "I(D)" zone

2.2.1 The Application Site currently falls within "I(D)" zone on the Draft Nam Sang Wai OZP No. S/YL-NSW/9. According to the Notes of the OZP, the planning intention of the "I(D)" zone is intended primarily for industrial uses that cannot be accommodated in conventional flatted factories due to extensive land and/or high ceiling requirements. It is also intended for the redevelopment of existing informal industrial uses, which are operated in workshop premises in rural area, to properly designed permanent industrial buildings.

2.2.2 According to the Notes of the OZP, the subject "I(D)" zone is currently subject to a maximum plot ratio of 1.6, a maximum site coverage of 80% and a maximum building height of 13m.

Planning Intention of "OS" zone

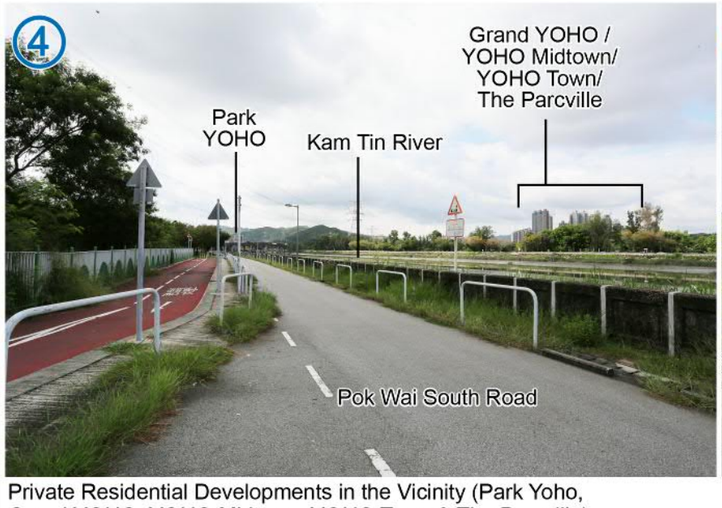
2.2.3 The Application Site currently falls within "OS" zone on the Draft Nam Sang Wai OZP No. S/YL-NSW/9. According to the Notes of the OZP, the planning intention of the "OS" zone is intended primarily for the provision of land for appropriate open storage uses and to regularise the already haphazard proliferation of open storage uses. It provides for the orderly development of land for open storage uses which cannot be accommodated in conventional godown premises.



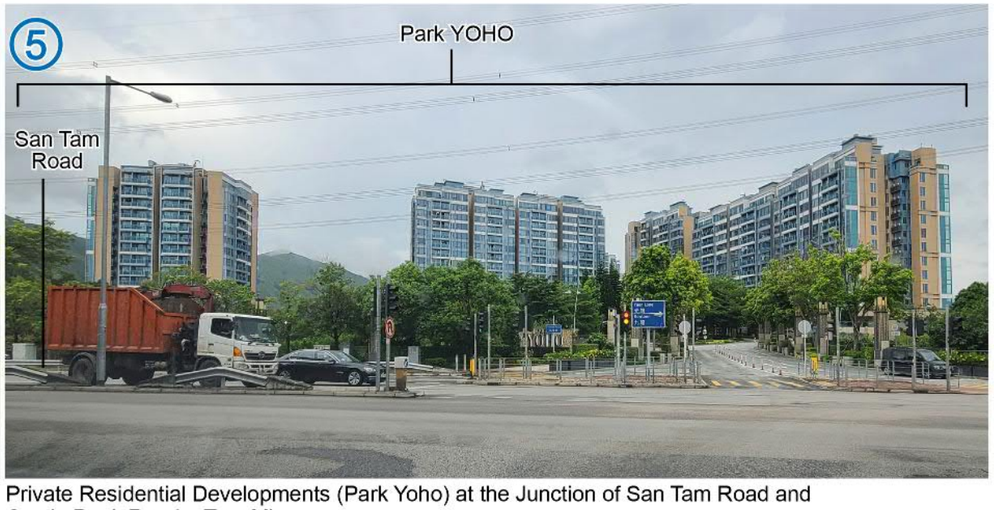
Existing Soy Sauce Factory and Container Storage Yard within the Application Site

Existing Views towards the West of the Application Site from Pok Wai South Road

Existing Brownfield Sites at the Southern Portion of the Application Site



Private Residential Developments in the Vicinity (Park Yoho, Grand YOHO, YOHO Midtown, YOHO Town & The Parcville)



Private Residential Developments (Park Yoho) at the Junction of San Tam Road and Castle Peak Road – Tam Mi

Town Planning Board Guidelines No. 12C

2.2.4 After the completion of the Study on the Ecological Value of Fish Ponds in the Deep Bay Area (Fish Pond Study) in 1997, the TPB concluded the Fish Pond Study and issued the first version of TPB PG-No.12C in 1999 (latest version May 2014) to facilitate developments within the Deep Bay Area.

2.2.5 The fundamental land-use planning concept for the Deep Bay Area should be the avoidance of fish ponds loss and habitat fragmentation as well as the mitigation of negative impact from undesirable land uses and human disturbance. A two-pronged approach to land use planning control is adopted through the designation of Wetland Conservation Area (WCA) for all existing continuous and adjoining active / abandoned fish ponds and the designation of Wetland Buffer Area (WBA) to prevent development that would have a negative off-site disturbance impact on the ecological value of fish ponds. This buffer generally comprises the strip of land of about 500m wide along the landward side of the WCA.

2.2.6 As shown in **Figure 2.5**, the Application Site is located at the fringe of WBA and is very far away from the Deep Bay. However, it should be highlighted that the Application Site has already been paved and currently occupied by a soy sauce factory and container storage yard. The Application Site also does not contain any wetland / fishpond, there is only a small section of narrow channel, plantation and wasteland found on-site with low to very low ecological values.

2.2.7 It is clearly stated in the Guidelines that "as a substantial amount of the fish ponds within the WBA have already been lost over time through filling and certain areas have been degraded by the presence of open storage use, these degraded areas may be considered as target areas to allow an appropriate level of residential / recreational development so as to provide an incentive to remove the open storage use and / or to restore some of the fish ponds lost."

Title

Deep Bay Wetland Buffer Area (WBA) and Wetland Conservation Area (WCA) Boundaries
(An Extract from Town Planning Board Guideline Section 12C)

Checked	DH	Drawn	PW
Rev	0	Date	Feb 2024
Scale		Figure	2.5

2.2.8 The subject rezoning proposal submitted under Section 12A of the TPO complies with the TPB PG-No. 12C as:-

i. The existing derelict condition renders the Application Site to be qualified as one of the 'target areas' as stated under the TPB PG-No. 12C to allow an appropriate level of residential / recreational development;

ii. The proposed comprehensive development includes a replacement of existing open storage and port back-up uses and hence should be given special consideration subject to satisfactory ecological and other impact assessments as depicted in later sections; and

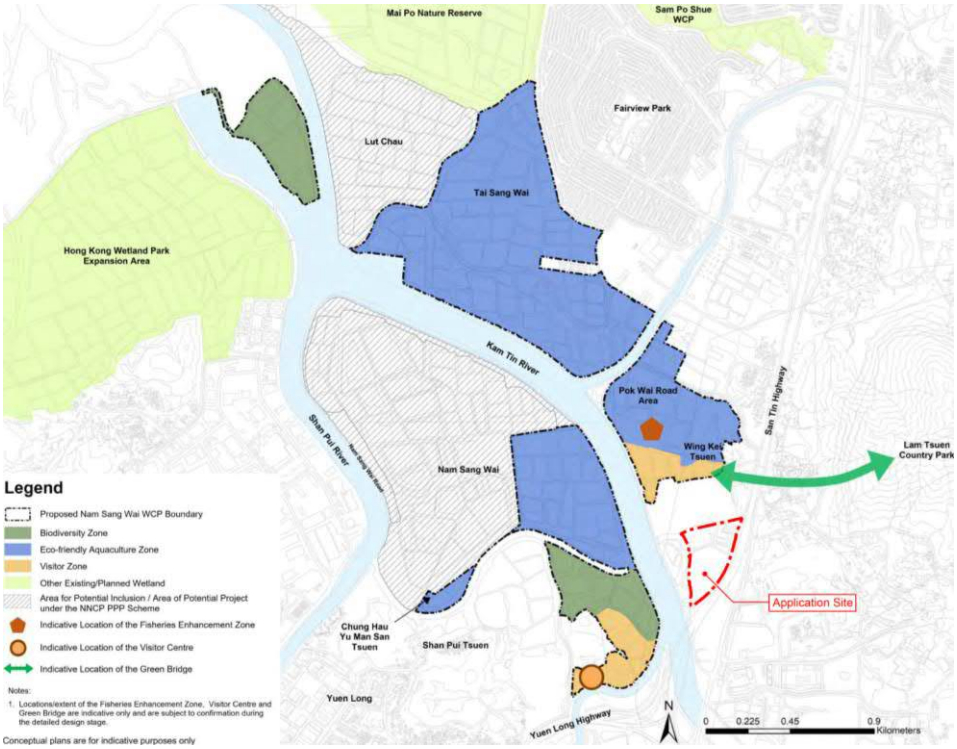
iii. An Ecological Impact Assessment has been prepared in support of the subject planning application. The assessment would demonstrate that the Proposed Development would have no negative off-site disturbance impact on the ecological value of fish ponds and wetland nearby

<u>AFCD Wetland Conservation Parks System (WCPs System)</u>

2.2.9 The development of a WCPs System was promulgated in the Northern Metropolis Development Strategy in 2021, with a view to conserving the Deep Bay wetlands with ecological value, and creating environmental capacity for the Northern Metropolis to achieve co-existence of conservation and development. The Strategic Feasibility Study on the Development of the WCPs System, commissioned by the Agriculture, Fisheries and Conservation Department (AFCD) in August 2022, had reviewed the ecological conditions, land use and planning matters, aquaculture activities, eco-education and recreation facilities, etc, in the proposed areas of the proposed WCPs System. The Feasibility Study also formulated recommendations on the overall implementation strategy for the development of the WCPs System, including the proposed boundaries, positioning and functions, conceptual plans and management options of the proposed Parks under the System. With implementation of the WCPs System, the wetlands in the Deep Bay area could be effectively conserved and their ecological value could also be enhanced. **More importantly, the development of the WCPs System could create environmental capacity for the development of the Northern Metropolis, and achieve co-existence of conservation and development.**

2.2.10 Conceptual plans for each of the Parks under the WCPs System have been developed. The WCPs System areas have been divided into different park areas, which the one most related to the Proposed Development is the Nam Sang Wai WCP. In this Park, the existing framework of fishponds and reedbed habitats would largely be maintained. This Park also aims to provide eco-recreation for public enjoyment through capitalising on the existing popular and iconic tourism attractions to be maintained where possible and adding new visitor facilities and eco-tourism attractions such as bird hides, cycling and walking trails in the ecologically less sensitive southern portion of the Park.

2.2.11 **The subject Application Site is situated outside the NSW WCPs and is located to the further south with low to very low ecological value, the proposal will therefore not induce any adverse impact to the NSW WCP.**



Location of Application Site and Nam Sang Wai Wetland Conservation Park

Previously Approved Planning Applications

2.2.12 Part of the Application Site was subject of a previous S12A rezoning approval (Application No. Y/YL-NSW/3) approved on 18 March 2016, which was in support of a shopping mall cum hotel development with a maximum plot ratio of 1.5 and a maximum building height of 10 storeys (above ground) on the southern portion of the Application Site.

2.2.13 The previous planning approval, together with the existing "I(D)" zone, demonstrate that the Application Site has in fact been suitable and readily available for development.

2.3 Land Ownership

2.3.1 The Applicant has largely secured the private lots and reached consensus with the owner of soy sauce factory within the Application Site. The Application Site is ready for development, a timely implementation of the Proposed Development can be warranted. **Figure 2.6** shows the land status of the lots within the Application Site. The land holding schedule is summarised in **Table 2.1**.

Table 2.1 Land Holding Schedule

	Area (m^2)	**Percentage (%)**
Private Land under Applicant's ownership (i.e. 1743 SC RP (Part)) REMARKS	38,980	48%
Private Lots under Acquisition (i.e. 1910 RP (Part))	26,856	33%
Government Land	15,714	19%
Total	**81,550m^2**	**100%**

Remarks
With consensus with the respective land owner, the lot of where the existing soy sauce factory is situated will be proposed for residential use and the existing soy sauce factory will be relocated and modernised at the southern tip of the Application Site.

3 REZONING CONSIDERATIONS

3.1 Development Potential offered by the Changing Spatial Planning Framework in the Northern New Territories

3.1.1 The **Hong Kong 2030+**, a strategic study for territorial spatial development, was updated and promulgated in October 2021. It serves as the planning framework for the future planning, land and infrastructures development. Specifically, it seeks to **showcase the potential for Hong Kong to lead by example as a global exemplar of compact high-density sustainable development**.

3.1.2 On the basis of the Hong Kong 2030+, the **Northern Metropolis Development Strategy (NMDS)** has been formulated and published by the Government in October 2021. The suggested development strategy **proposes to expand the Northern Economic Belt to cover new towns in Yuen Long**, Tin Shui Wai and Fanling / Sheung Shui, and various New Development Areas and development nodes in different planning and construction stages **as well as their neighbouring rural areas**.

3.1.3 The **Northern Metropolis Action Agenda** was then issued by the government on October 2023 based on the **NMDS**. According to the action agenda, the Northern Metropolis will be divided into four major development zones given the characteristics and strengths of different areas. The Application Site is situated within one of the four major development zones (i.e. Innovation and Technology Zone). The focus development of this zone is the San Tin Technopole, which not only acts as the core of industrial development in the Northern Metropolis, but also intended to become a liveable town with comprehensive community facilities. It will become an International I&T hub, with unique metropolitan landscape marked with "Urban-Rural Integration and Co-existence of Development and Conservation".

Location of Application Site within Northern Metropolis

3.1.4 The updated spatial planning framework demonstrated that the Northern New Territories, especially for San Tin and its neighbouring areas, will be transformed into a brand-new focal development node of our future Hong Kong. **With a forward planning perspective, developments with higher development intensity should be encouraged in the area to realise the strategic planning directives**.

3.2 Anchor Housing Development to Support San Tin Technopole

3.2.1 To complement the long-term sustainable growth of the Northern Metropolis, it is fundamental to have a balanced and diversified land-use pattern. With focal economic and innovation developments clustered at San Tin Technopole along the frontier area of New Territories North, it would inevitably drive up the demand for more development of domestic uses into the inner parts of the New Territories to serve those commercial and non-domestic developments.

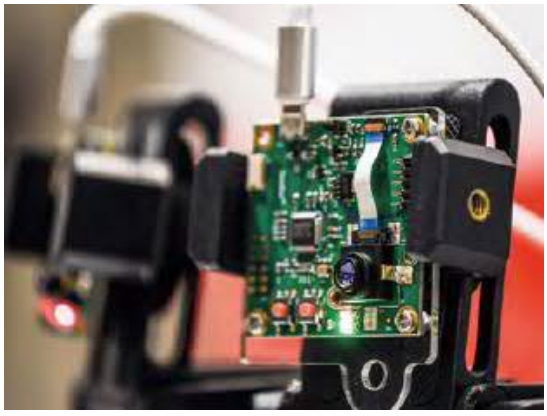
3.2.2 The San Tin Technopole is planned to comprise mainly an I&T Park and a San Tin Town Centre. According to the approved San Tin Technopole OZP, the area will be one of the major land sources for the total of 3,370 ha developable land estimated to be available in 10 years from 2024-2025 to 2033-2034. Together with the HSITP at the Loop, the Technopole will supply about 300 ha of I&T land, which is capable of accommodating a total gross floor area (GFA) of about 7 million m^2. The portion within the San Tin Lok Ma Chau area is planned to have an area of about 210 ha and a total GFA of about 5.7 million m^2 with a view to creating a critical mass to foster I&T advancement, driving the development of an international I&T hub and deepening the I&T collaboration with Shenzhen and the world.

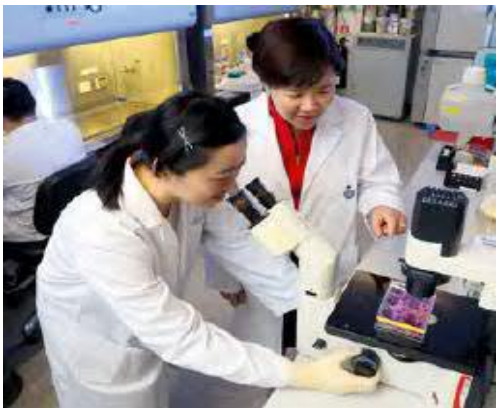
3.2.3 Overall, the San Tin Technopole will accommodate a total of 217,000 employment opportunities. To further reflect on both the present and future urban development outlook brought by (i) the growing I&T industry in San Tin Technopole; (ii) the ample economic opportunities of the Innovation and Technology Zone of the Northern Metropolis; and (iii) the need for talent homes to accommodate students / employees in the technological zone, the Applicant has adopted a forward-looking planning perspective to re-examine the future development prospects of the subject Application Site. **It is therefore important to better harness the development potential of the Application Site to serve as an anchor housing development to complement the region's long-term employment population growth.**

3.2.4 The planned 217,000 employment opportunities in San Tin Technopole will generate huge demand for housing units. Like other major cities, Hong Kong currently has a heavy vehicular and pedestrian flow commuting back and forth from major employment hubs. The Hong Kong Government is committed to shorten the commuting time for the public between their living and working spaces and so as to reduce the need for daily travels as well as the resultant traffic congestion in the road network. One of the best solutions is to plan the new development areas with balanced living and work opportunities and so that the people do not have to travel across on a daily basis.

3.2.5 According to the approved San Tin Technopole OZP, it is estimated that the total planned population would be about 165,600 persons. Comparing to the planned 54,000 residential units as planned under the San Tin Technopole, it is foreseeable that there will be a huge gap between the housing demands likely to be generated by the 217,000 employment opportunities within the San Tin Technopole. **By contributing about 3,115 units with the Proposed Development under this rezoning application, it helps to meet to a significant portion of the expected shortfall in provision of residential units in the area and help creating a balanced and self-contained community as far as possible.**

3.2.6 In parallel, it is noted that there is another planning application for comprehensive development with a maximum domestic GFA of about 255,708m^2 to provide about 6,825 units situated to the immediate north of the Application Site (i.e. Y/YL-NSW/8). Altogether, the overall provision of about 10,000 units can effectively alleviate the shortfall of housing supply brought about by in San Tin Technopole.





Ample Employment Opportunities in San Tin Technopole would Generate Huge Demand on Housing

3.3 Government's Endeavours in Enhancing Housing Land Supply

(i) Policy Directives to Unleash Development Potential of Lands within WBA

3.3.1 In early years, the Government demarcated and designated a strip of land of about 500m in width covering 1,300 hectares along the boundary of the WCA as WBA. To avoid any irreversible adverse impacts on the wetland habitats of the Deep Bay Area, the TPB promulgated the TPB PG-No. 12 in 1993 and subsequently made revisions in 1994, 1999 and 2014. The original intention of the WBA is to only function as a buffer to prevent negative off-site disturbances from developments onto the wetlands in the WCA, but not to prohibit any development in WBA.

3.3.2 However, as the freshwater fish farming industry has declined over time, a significant number of fish ponds in WBA have been left deserted/abandoned degrading into wastelands. In view of the changing planning circumstances and to meet social needs, the Government will review the Planning Guidelines relating to the WBA on the premise of balancing the needs for conservation and increase of housing land supply. To facilitate possible developments within the WBA, the development approval processes for both Government and private projects will also be reviewed comprehensively so as to rationalise the development-related requirements imposed by different bureaux[3]. This recommendation echoes with the intention of the latest TPB PG-No 12C, which states that "degraded areas may be considered as target areas to allow an appropriate level of residential / recreational developments so as to provide an incentive to remove the open storage use and / or to restore some of the fish ponds lost."

3.3.3 **The Application Site with no significant ecological value within WBA is considered suitable for development, subject to a compatible development intensity and technical assessments proving its feasibility. The subject rezoning application would also be in line with the Government's intention to further optimise the development potential of land resources in WBA with a view to enhancing housing supply.**

[3] Written reply by the Secretary for Development, Mr Michael Wong, in response to a question raised by the Hon Lau Kwok-fan in the Legislative Council on 24 March 2021
(Source: https://www.info.gov.hk/gia/general/202103/24/P2021032300585.htm?fontSize=1)

3.3.4 As a matter of fact, in some of the zones inside WBA, some current development are having a plot ratio ranging from 1.5 to 4.45 (see Table 3.1 below).

Table 3.1 Previously Approved Planning Applications for Medium-density Residential Developments in WBA

Location	Zoning	Plot Ratio	Building Height (excluding basement(s))
Wetland Seasons Bay, Tin Shui Wai *(No. A/TSW/70 approved on 8.12.2017)*	"CDA"	1.5	Max. 10 storeys (44.25mPD)
Wetland Seasons Park, Tin Shui Wai *(No. A/TSW/63 approved on 20.11.2015)*	"CDA"	1.5	Max. 10 storeys (41.8mPD)
Wing Kei Tsuen Rezoning *(No. Y/YL-NSW/7 approved on 10.11.2023 and gazette on 12.7.2024)*	"OU(CDWRA)" to "OU(CDWRA) 1"	1.548	Max. 15 storeys (53.95mPD)
Land Sharing Pilot Scheme No. 002 at Ho Chau Road, Yuen Long *(Gazette on 12.7.2024)*	"R(D)" to "R(A)1" and "R(A)2"	4.45 (Public Housing Portion) 2.16 (Private Housing Portion)	Max. 26 storeys (100mPD)

(ii) Unleashed Development Potential from Enhanced Infrastructure Capacity by the Northern Link (NOL)

3.3.5 In order to tackle the unprecedented double ageing of population and building stock as well as the acute shortage of housing supply, a two-pronged approach has been proposed at the strategic spatial planning level, including developing liveable new districts whereby decanting space is provided for redeveloping the dense urban core; and concentrating development along axes and nodes and creating a tight network of complementary function.

3.3.6 The strategic position being enjoyed by the Application Site demonstrates the potential and ability as a buildable housing land. According to the Northern Link (NOL) Project Profile prepared by the MTR Corporation Limited (MTRCL), the NOL will form railway loop in the northern new territories that drives land and economic development along the alignment. The Secretary for Transport and Logistics also recently updated that the government will seek funding approval for the investigation works for the NM Highway shortly, whereas the construction works are targeted to commence by 2028. The San Tin Section of this strategic highway, which is in close proximity to the Application Site, is promulgated and scheduled for opening in or before 2036.

3.3.7 With the construction of the NOL and Northern Metropolis Highway scheduled to commence in 2025 and complete in 2034 and 2036 respectively, **the NOL will not only increase the transport capacity of surrounding planned key government projects, but also incentivise surrounding land owners to advance their private development plans with larger housing yields.**

3.3.8 As the planned Au Tau Station of the NOL will be implemented about 150m away to the immediate east of the Application Site, the development opportunities of the Application Site can be further optimised for higher-density development so to **realise the government's infrastructure-led as well as transit-oriented development (TOD) planning approach.**

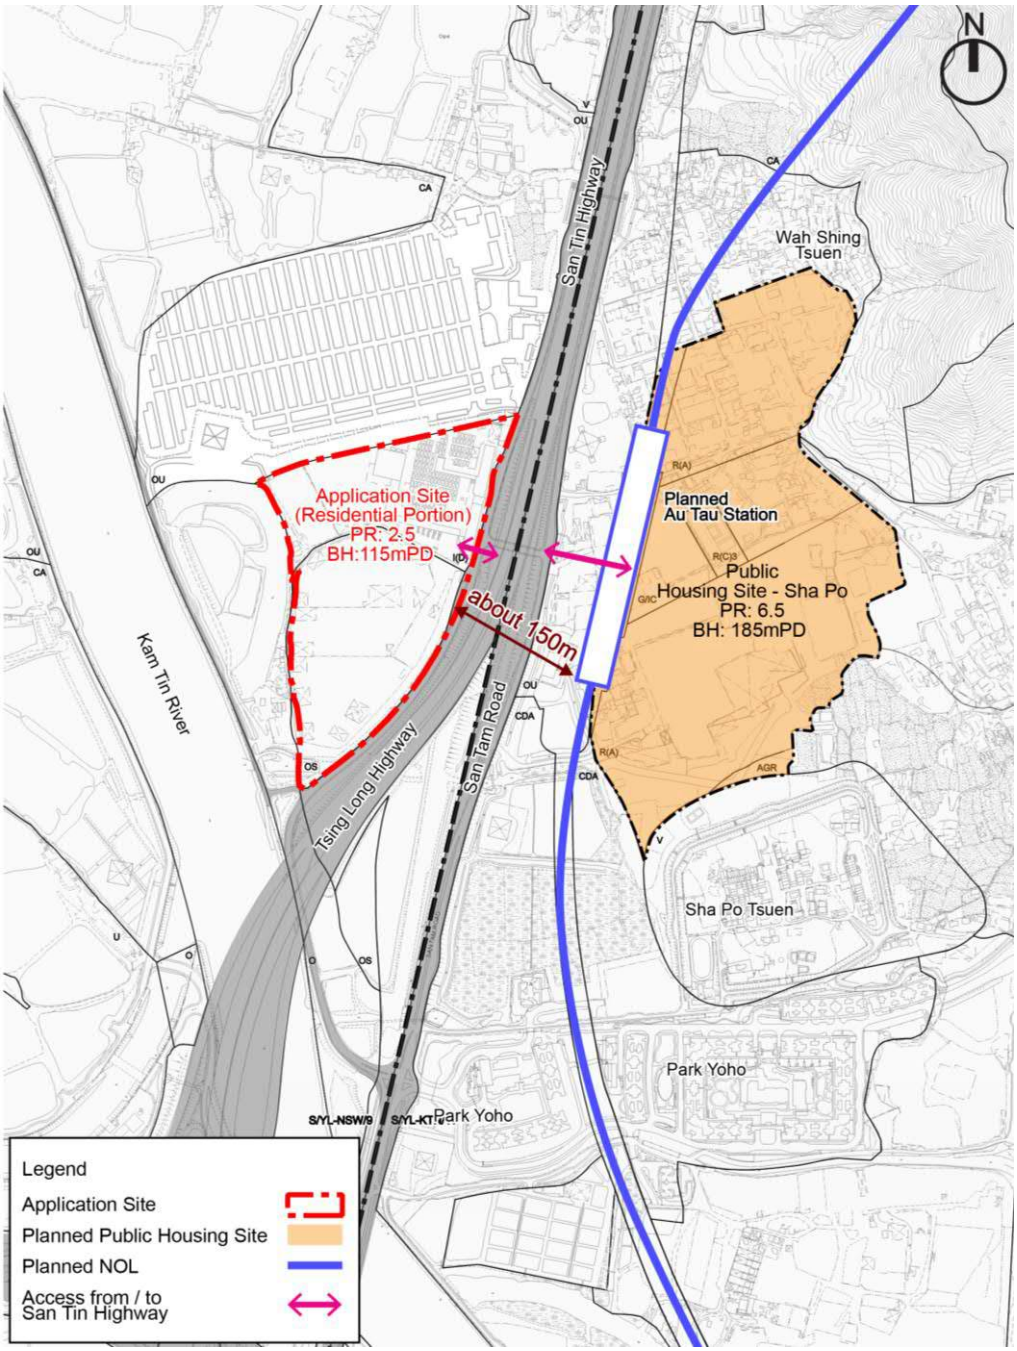
(iii) Contribute to Increasing Land Supply to Address Long Term Housing Need

3.3.9 According to latest 2024 PA, the Government aims to deliver about 3,000 ha of newly formed land in the coming 10 years (2025-26 to 2034-34) for housing supply, which includes about 1,700 ha of land from the Northern Metropolis. The Government also aim to make land available for the production of around 80,000 private housing units in the next five years (2025-26 to 2029-30). According to the 2024 Long Term Housing Strategy, the projected total housing supply target for the coming 10 years (2025-26 to 2034-34) is around 440,000 units. The Application Site, together with the site adjacent under separate planning application (i.e. Y/YL-NSW/8), will be able to provide about 10,000 private housing units, which contribute to the government visions to increase land and housing supply.

3.4 Compatible with the nearby Sha Po Public Housing Development

3.4.1 To expedite housing land supply in Hong Kong, the Government has been continuously carrying out various land use reviews, including the intensification of housing sites, with a view to providing more housing units to Hong Kong citizens.

3.4.2 As identified under the Government's "Study on Existing Profile and Operations of Brownfield Sites in the New Territories" released in November 2019, there is a site situated to the east of the Application Site across San Tam Road and adjacent to the planned Au Tau Station selected for public housing development. To take forward implementation of the Sha Po Public Housing development and related GIC facilities, the land-use zoning of the concerned approved Kam Tin North Outline Zoning Plan No. S/YL-KTN/11 has been rezoned as "Residential (Group A)" in January 2023. This Sha Po Public Housing Development Site shares similar site characteristics as the Application Site including, inter alia, (i) easily accessible to adjacent San Tin Highway, and (ii) close proximity to the planned Au Tau Station. The locations of the Application Site and the Sha Po Public Housing Development Site are illustrated below.



The Application Site is in Close Proximity with the Sha Po Public Housing Development Site and Au Tau Station of the NOL

3.4.3 As per the OZP, the public housing development will have a domestic PR of 6.5 on top of a non-domestic PR of 0.2 and a maximum BH of 185mPD. The development will provide about 16,300 units.

3.4.4 Taking into account the development intensity of the Sha Po Public Housing Development, the proposed domestic GFA of about 115,942m^2 and BH of not more than 115mPD of the Application Site is appropriate and compatible with the surrounding development context (**Figure 2.4** refers). The proposed medium-density development can also serve as an effective visual transition between the public housing development to the east and the existing river, fish ponds / restored wetland to the northwest and west of the Application Site.

3.5 In Line with the Changing of Local Circumstances in Yuen Long

3.5.1 The planning of Yuen Long has been continuously evolving over time. Initially with nodal developments around Yuen Long Kau Hui and Yuen Long San Hui, Yuen Long New Town had then further developed around the transit-oriented, high-rise and high-density mixed-use comprehensive developments at the Yuen Long Station and Long Ping Station along Tuen Ma Line. In recent years, the periphery of the New Town can be seen extending towards northeast along Castle Peak Road. Large-scale residential clusters just to the southeast of the Application Site across San Tin Highway, where Park Yoho is situated, are emerging (see **Table 3.2** below).

3.5.2 Considering the measures / actions promoted by the Government, coupled with the current medium to high-density development setting in the surrounding areas of the Application Site (e.g. Park Yoho and Sha Po Public Housing Development), **the Proposed Development is fully compatible with the changing local development context in Yuen Long** (**Figure 2.3** refers)**.**

Table 3.2 Completed, Approved and Planned Residential Developments in Close Proximity of the Application Site

Location	Zoning	Plot Ratio	Max. Building Height (excluding basement(s))
Completed Developments			
Sun Yuen Long Centre, Yuen Long	"OU"	6.71	28 storeys (104.75mPD)
Grand YOHO, Yuen Long	"CDA"	5.82	41 storeys (174.2mPD)
Twin Regency, Yuen Long	"R(E)1"	4.99	22 storeys (83.5mPD)
One Regent Place, Yuen Long	"R(B)1"	3	25 storeys (90.1mPD)
The Parcville, Yuen Long	"R(B)2"	3	15 storeys (53.65mPD)
Park Yoho, Yuen Long	"CDA"	1.024	16 storeys (60.2mPD)
Crescent Green, Yuen Long	"R(B)1"	1.199	13 storeys (83.5mPD)
The Riva, Yuen Long	"R(B)"	1.27	23 storeys (82mPD)
Approved Developments			
Sha Po Public Housing Development (Gazette on 15.12.2023)	"R(A)"	6.7	52 storeys (185mPD)
Land Sharing Pilot Scheme No. 002 at Ho Chau Road, Yuen Long (Gazette on 12.7.2024)	"R(A)1" & "R(A)2"	4.45 (Public Housing Portion) 2.16 (Private Housing Portion	26 storeys (100mPD)
Park Yoho (Phase 2), Yuen Long (No. A/YL-KTN/663 approved on 26.5.2020)	"CDA"	1.67	16 storeys (62.2mPD)
Park Yoho (Phase 3), Yuen Long (No. A/YL-KTN/604 approved on 22.3.2019)	"CDA(1)"	1.254	18 storeys (66.35mPD)
Sha Po South Extension (No. A/YL-KTN/964 approved on 15.3.2024)	"R(E)"	1.43	17 storeys (65.93mPD)

4 THE REZONING PROPOSAL

4.1 Proposed Amendments to the Draft Nam Sang Wai OZP

4.1.1 The Applicant intends to seize this unique opportunity to optimise the residential / industrial interface of the Application Site. In parallel, the Applicant seeks to unleash the development potential of the Application Site for a medium-density residential use, which could provide complement the changing spatial development framework of the area. To facilitate this planning intention, it is proposed to rezone the Application Site from "OS", "I(D)" and 'Road' zones to a "R(E)" zone or an alternative option with incorporation of a tailor-made "Other Specified Use" annotated "Industrial" zone if deem appropriate by the Town Planning Board

Original Option

4.1.2 The original option will rezone the Application Site into one "R(E)" zone with 3 development portions namely:

1. Residential Portion (with a total maximum domestic GFA of about 115,942m^2 and a maximum building height of not more than 115mPD);

2. Relocated Soy Sauce Factory Portion (with a maximum GFA of not more than 13,700m^2 and a maximum building height of not more than 15m); and

3. A site of site area of 6,200m^2 has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

4.1.3 Respective proposed development parameters to be reflected in the proposed Notes of the proposed "R(E)" zone on the OZP are provided as follows:

Table 4.1 Proposed Development Restrictions of Schedule I in "R(E)" zone (Original Option)

Schedule I: **For open air development or for building other than industrial building**	
Proposed Development Restrictions	**Proposed "R(E)" Zone**
Maximum PR	Not more than 2.73
Maximum Building Height	Not more than 115mPD

Table 4.2 Proposed Development Restrictions of Schedule II in "R(E)" zone (Original Option)

Schedule II: **For existing industrial development (including relocation of existing industrial development falling within the same "R(E)")**	
Proposed Development Restrictions	**Proposed "R(E)" Zone**
Maximum Non-domestic GFA	Not more than 13,700m^2
Maximum Building Height	Not more than 15mPD

4.1.4 The proposed amendments to the Plan and Notes of the "R(E)" zone are enclosed in **Appendix A1**.

Alternative Option

4.1.5 If it is considered necessary to provide a more certain degree of planning control and land-use framework for the relocated soy sauce factory, the Applicant has come up with another alternative OZP amendment option for consideration. Under the proposed alternative option, a tailor-made "Other Specified Uses" annotated "Industrial Uses" ("OU(I)") zone is proposed for the relocated soy sauce factory. The planning intention, Schedule of Uses and Notes have been formulated taking into account the design of the factory building and the unique operation procedure of the soy sauce factory. In particular, new development or redevelopment of the existing soy sauce factory (i.e. defined as "Industrial" use) will require planning application for permission before development / redevelopment so as to allow more control on the design by the Town Planning Board and Government departments.

4.1.6 Under this alternative option, the development portion other than the relocated soy sauce factory will remain as a "R(E)" zone. The proposed "R(E)" zone will consist of 2 components namely:-

1. Residential Portion (with a total maximum domestic GFA of about 115,942m^2 and a maximum building height of not more than 115mPD); and

2. A site of site area of 6,200m^2 has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

4.1.7 Respective proposed development parameters to be reflected in the proposed Notes of the proposed "OU(I)" zone and "R(E)" zone on the OZP are provided as follows:

Table 4.3 Proposed Development Restrictions of Schedule I in "R(E)" zone (Alternative Option)

Schedule I: **For open air development or for building other than industrial building**	
Proposed Development Restrictions	**Proposed "R(E)" Zone**
Maximum GFA	Not more than 126,242m^2
Maximum Building Height	Not more than 115mPD

Table 4.4 Proposed Development Restrictions of "OU(I)" zone (Alternative Option)

Proposed Development Restrictions	**Proposed "R(E)" Zone**
Maximum Non-domestic GFA	Not more than 13,700m^2
Maximum Building Height	Not more than 15mPD

4.1.8 For details, please refer to the proposed amendments to the Plan and Notes of the "OU(I)" zone and "R(E)" zone in **Appendix A2**.

4.1.9 The Applicant has conducted a planning study on the proposed land-use zoning boundaries for different portions of developments under this alternative option. For details, please see **Appendix A3**.

4.2 Indicative Development Scheme and Development Schedule

4.2.1 By seeking agreement from the operator of the existing soy sauce factory on-site, the Applicant now proposes to optimise the spatial planning of the Application Site by relocating the factory portion to the southern portion of the site which is already a disturbed open storage brownfield site abutting to the San Tin Highway and is further away from Deep Bay. The new soy sauce factory to be provided on the southern portion of the site will be a modernised factory with an environmental-friendly production mode, which will improve the quality of the local environment and hence renders an opportunity for the Applicant to re-visit the development potential for the remaining portion of the Application Site.

4.2.2 In support of the above proposed planning intention, an indicative development proposal has been prepared. According to the indicative scheme, the northern portion of the Application Site will be proposed to be a medium-density comprehensive development with residential and supporting commercial and ancillary uses. The southern portion of the Application Site will be for the future operation of the relocated existing soy sauce factory. To cater for the potential educational needs of the area's future population, a reserved site for primary school has been reserved within the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy. The Indicative Master Layout Plan, Floor Plans and Indicative Section Plans of the Proposed Development are shown in **Figures 4.1** to **4.8**.

4.2.3 For the proposed development parameters of the indicative development scheme in support of the rezoning application, please refer to **Table 4.5** below.

llewelyn davies

Title

Indicative Demarcation of Development Portions

Checked	DH	Drawn	PW
Rev	0	Date	Feb 2024
Scale NA		Figure 4.1	

1. All spot levels marked on the building structures (including towers, clubhouse and GIC blocks) refer to the main roof levels.
2. No.of storeys marks on plans show total no.of storeys including towers and podiums, excluding basement(s).
3. "Commercial uses" include 'Eating Place', 'Shop and Services', 'School' (kindergarten, nursery, language, computer, commercial and tutorial schools, arts school, ballet and other types of schools providing interest/ hobby related courses), 'Place of Entertainment' and 'Place of Recreation, Sports or Culture'

Table 4.5 Indicative Development Schedule

Development Parameters	
Application Site Area (m^2) (about)	81,550 (1)
Residential Portion	47,891 (1)
Relocated Soy Sauce Factory Portion	27,459
Reserved School Site	6,200
Development Site Area (m^2) (about)	73,960 (2)
Residential Portion	46,501
Relocated Soy Sauce Factory Portion	27,459
Residential Portion	
Domestic GFA (m^2) (about)	115,942
Non-domestic GFA (m^2)	
Commercial Uses (m^2) (3) (about)	3,900
Covered Transport Lay-by (m^2) (about)	6,400
Maximum Building Height (to the main roof)	Not more than 115mPD
No. of Residential Towers	11
No. of Units	3,115
Average Flat Size (m^2) (about)	37.2
No. of Domestic Storeys (4)	Not more than 28
No. of Non-domestic Storeys	
Non-domestic Podium (5)	Not more than 1
Basement Carpark	1
Anticipated Population (6)	8,099
Communal Private Open Space (m^2) (7)	8,099
Maximum Site Coverage (above ground)	
Domestic	< 33.33%
Non-domestic	< 100%
Clubhouse Facilities (8)	
GFA (m^2) (about) (9)	3,500
No. of Storeys	2
Relocated Soy Sauce Factory Portion (10)	
Non-domestic GFA (m^2)	Not more than 13,700 (11) (12)
Maximum Building Height (to the main roof)	Not more than 15 mPD (11)

Remarks:

(1) Include portion of Government land currently occupied by some temporary structures at the western portion of the Application Site with an area of about 1,390m^2.
(2) Including the proposed public road within the Application Site and the proposed traffic improvement works along Castle Peak Road.
(3) Include commercial GFA for 'Shop and Services', 'Eating Place, 'School' (nursery / kindergarten / language, computer, commercial or tutorial schools / technical institutes / other types of schools providing interests and hobby related courses for subjects such as arts, ballet and etc.), 'Place of Entertainment' and 'Place of Recreation, Sports or Culture' uses at the commercial portion.
(4) Exclude transfer plates.
(5) Including commercial uses and Covered Transport Lay-by.
(6) Assuming a Person-Per-Flat ratio of 2.6 as per the suggestion in HK2030+.
(7) Not less than 1m^2 per person according to HKPSG.
(8) Exempted from plot ratio calculation.
(9) Or such other areas of clubhouse as may be approved by the Buildings Department based on the total permissible domestic GFA for individual land parcel (site under the Buildings Ordinance) at the future GBP.
(10) For the manufacture of soy, sauce, preserved fruits or vegetables or Chinese sweetmeats and no domestic buildings shall be erected thereon except ancillary premises that the District Commissioner, New Territories (Lands Department) may consider reasonable for accommodating staff and workers employed on the premises.
(11) In order to facilitate the future operation of the relocated soy sauce factory, about 7,300m^2 of the floor area of the future plant room will have a high headroom of about 8m and about 6,400m^2 of the floor area of the future plant room will have a headroom of about 5m.
(12) The floor space that is constructed for plant rooms (including steam boiler rooms, fan rooms, air compressor room, photo voltaic (PV) panel room, LPG store, DG chemical store, waste water treatment plant and associated plant rooms) for the relocated soy sauce factory is exempted from GFA calculation.

Residential Portion

4.2.4 The Proposed Residential Portion is located at the northern portion of the Application Site. It has a development site area of about 46,501m^2, a domestic GFA of about 115,942m^2 and comprises 11 nos. of residential towers. The maximum building height (to the main roof) is not more than 115mPD, with stepped building heights profile descending from east to west.

4.2.5 The Proposed Development provides about a total 3,115 nos. of flats. Based on a Person-Per-Flat ratio of 2.6 as per the suggestion in HK2030+, the Proposed Development accommodates a population of about 8,099 persons. Clubhouse facilities will also be provided. A non-domestic GFA of about 10,300m² is also proposed to support the needs of the future residents and the wider community, which comprises of commercial GFA of about 3,900m^2 and a covered transport lay-by of GFA of about 6,400m^2.

4.2.6 The commercial facilities will include 'Shop and Services', 'Eating Place, 'School' (nursery / kindergarten / language, computer, commercial or tutorial schools / technical institutes / other types of schools providing interests and hobby related courses for subjects such as arts, ballet and etc.), 'Place of Entertainment' and 'Place of Recreation, Sports or Culture' uses.

4.2.7 The transport lay-by will serve both the future residents and the surrounding neighbourhood to contribute to their daily commute needs, which strengthen the connectivity with Yuen Long Station and Yuen Long New Town, as well as other sub-urban and fringe areas.

4.2.8 Looking at the wider context, another proposed comprehensive development comprising residential, commercial and other ancillary uses within a proposed "OU(CDWRA)1" zone are proposed under separate planning application (i.e. Y/YL-NSW/8). The development will be situated between the Proposed Residential Portion and the existing ponds to the further northwest.

Reserved School Site

4.2.9 To cater for the potential educational needs of the area's future population, a site (of site area of 6,200m^2) has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

Relocated Soy Sauce Factory Portion

4.2.10 The southern portion of the Application Site will be reserved for the relocation of the existing soy sauce factory. A total non-domestic GFA of not more than 13,700m^2 and a maximum building height of not more than 15mPD are allowed for the operation of the relocated soy sauce factory.

4.2.11 Since the existing soy sauce factory within the Application Site has been in operation for years, the existing levels of odour, noise and emissions should have been tolerated. Nevertheless, since there would be a future residential development and the reserved school site close to the relocated soy sauce factory, careful design considerations should be considered to ensure the compatibility amongst different uses. While the detailed layout is subject to detailed design and future operation of the soy sauce factory, the following design considerations should be taken into account:-

(i) A separate vehicular access will be reserved for the relocated soy sauce factory to connect with Castle Peak Road to minimise the any possible interfacing issues with the access of the future residents of the proposed residential development;

(ii) The future relocated soy sauce factory will be designed and powered by electricity to eliminate stack emission.

(iii) Operations that would generate odour will be housed indoor, the exhausts within the building will be centralized and deodorized by deodorization units before emission;

(iv) The exhaust air louver will be located on southern façade of the relocated soy sauce factory which is away from the proposed residential development;

(v) The outdoor sun-drying area for semi-product aging is located to further south away from any air sensitive uses. The concrete tanks for sun-drying will be covered with transparent plastic pane at all-time except during collecting bean paste and not more than 3 concrete tanks will be opened at the same time;

(vi) Any noisy facilities will be designed to meet HKPSG standard; and

(vii) Proper drainage and sewerage system will be constructed with necessary wastewater treatment facilities installed to treat effluent to acceptable standard before discharge to public sewerage system. There will be no direct discharge of wastewater to surrounding water body.

4.2.12 As such, under the subject rezoning planning application stage, there will be no in-principle unacceptable environmental noise, air quality and water quality impact due to the future operation of the soy sauce factory. For details of the design mitigation proposals, please refer to **Appendix E – Environmental Assessment** for consideration.

4.2.13 To provide additional planning control, a tailor-made "OU(I)" land-use zoning has also been proposed under the alterative OZP amendment option. Under this option, the new development / redevelopment of the soy sauce factory will require future S16 planning application for permission. Detailed layout and design of all mitigation measures of the soy sauce factory will be considered and approved by the Town Planning Board and relevant Government departments before implementation.

4.3 Landscape Design Consideration

4.3.1 The Indicative Landscape Master Plan (LMP) and Section Plans are attached as **Figures 4.9** to **4.11** to illustrate the proposed landscape design concept of the proposed development. The details of the Landscape Design Proposal are provided in **Appendix B**.

4.3.2 The design objectives of the LMP are to:-

(i) To create a landscape design that corresponds to the specific site conditions of the Proposed Development;

(ii) To ensure the Proposed Development is sensitively integrated into the neighbouring areas via naturalistic edge treatments;

(iii) To ensure the character of the landscape design that compliments the aesthetic of the architectural elements and is consistent with the overall design language;

(iv) To minimise the visual impact of the Proposed Development through carefully planned landscape treatment;

(v) To create suitable outdoor spaces for active and passive recreational activities; and

(vi) To promote the use of native plant species throughout the landscape area to contribute to the sustainability of the site and the adjacent neighbourhood, and to introduce exotic ornamental species where necessary and to enrich the sense of place of featured areas.

4.3.3 With consideration to achieving urban-rural integration, landscape features to be provided in the Proposed Development include:

- Landscape at main access – Accesses to the Proposed Development will be located along the existing Castle Peak Road. The entry to the residences will be defined by attractive trees and shrubs planting with a feature tree and paving to create a welcoming entrance and signature identity;

Combined Indicative Master Layout Plan (Proposed Developments under Planning Application No. Y/YL-NSW/8 & Y/YL-NSW/9)

Checked	DH	Drawn	PW
Rev	0	Date	Feb 2025
Scale		Figure	4.12

- Streetscape – Extensive soft landscaping is proposed to create a green interior streetscape. The planting will aim to provide colour and texture to the streetscape throughout the year and generally soften the appearance of the architectural elements. On the north-western and southern sides of the Application Site, trees will be planted as a noise and visual buffer from the adjacent meander of Kam Tin River;

- Residential Area – Hard and soft landscape spaces are proposed around the residential towers to complement the built environment. Planting schemes with themed planting palettes will differentiate different character zones. A selection of natural and contemporary materials will be chosen to produce attractive design solutions; and

- Recreational Facilities and Communal Gardens – A selection of recreational facilities, landscape garden and communal gardens will be integrated into the landscape areas and the upper level of the commercial areas and the covered transport lay-by for all residents and visitors. Outdoor seating will be provided at the gardens, where extensive ornamental shrub planting beds will be created to provide seasonal interest and layers of texture throughout the year. Intergenerational play areas and undulating landscape mounds for play and picnics will also be provided within these spaces.

4.3.4 There are 7 tree groups containing a total of approximately 315 nos. of existing trees affected by the Proposed Development. Trees along the site reserved for the school and soy sauce factory will also be affected by future site works. Since these trees are all found to be in poor form and poor to fair health condition with low amenity value and low survival rate, they are all proposed to be felled. A minimum of 315 nos. of standard trees of enhanced quality will all be planted in the Development Site of the Proposed Residential Portion to compensate for the felled trees within the entire Application Site (including those felled in the School Portion and Soy Sauce Factory Portion) thereby achieving a compensatory planting ratio of 1:1.

4.3.5 With a total greenery area of not less than 13,950m^2, the minimum 30% greenery for the Proposed Residential Portion is achieved in accordance with the requirement of PNAP (APP-152). A total open space of not less than 8,099m^2 is also proposed to achieve a minimum standard of 1m^2 per person as stipulated in Chapter 4 of the HKPSG.

4.4 Access Arrangement & Internal Transport Facilities

Development Access

4.4.1 The Application Site is currently served by Castle Peak Road – Tam Mi Section which runs along the eastern side of the Application Site. To enhance the road capacity, it is proposed to widen the existing Castle Peak Road – Tam Mi adjoining the Application Site to a 10.3m wide single carriageway.

4.4.2 Two vehicular access would be provided at Castle Peak Road – Tam Mi for the residential development, covered transport lay-by, reserved school site and existing temporary structure. A separate vehicular access would also be maintained at Castle Peak Road –Tam Mi for the relocated soy sauce factory.

Internal Transport Facilities

4.4.3 The internal transport facilities of the Proposed Development will be provided in accordance the requirements stipulated under the latest Hong Kong Planning Standards and Guidelines (HKPSG). The respective requirements and provision are summarised in **Table 4.4** below. For detailed breakdown of the parking and servicing facilities, please refer to **Appendix D** for consideration.

Table 4.6 Proposed Car Parking and Servicing Facilities Provision

Parking and Serving Facilities	Total
Private Car Parking Spaces	
• Residential	234 (1)
• Residential (Visitor)	55
• Retail	18 (2)
• Kindergarten	2 (3)
• Relocated Soy Sauce Factory	12
Total	321 (4)
Motorcycle Parking Spaces	
• Residential	25 (5)
• Retail	2
• Relocated Soy Sauce Factory	1
Total	28
Loading and Unloading	
• Residential	11
• Retail	4 (6)
• Relocated Soy Sauce Factory (Goods Vehicle)	16
• Relocated Soy Sauce Factory (Container Vehicle)	1
Total	32
Others	
• Private Car / Taxi Lay-by for Kindergarten	2 (3)
• Small Coach Lay-by for Kindergarten	5 (7m x 3m each)
• Bicycle Parking Spaces for Residential	208 (7)

Note:
(1) Global Parking Standard (GPS) of 1 car space per 5 flats adopted.
(2) A provision of 1 private car parking space per 225m^2 GFA is adopted for retail development based on the requirement in HKPSG (1 car space per 150-300m^2).
(3) High-end provisions of parking and loading/unloading facilities for kindergarten are proposed.
(4) Accessible car parking spaces will be reserved for persons with disabilities in accordance with the HKPSG.
(5) A provision of 1 motorcycle parking space per 125 flats is adopted for residential development based on the requirement in HKPSG (1 motorcycle parking space per 100-150 flats).
(6) A provision of 1 loading / unloading bay per 1,000m2 GFA is adopted for retail development based on the requirement in HKPSG (1 loading / unloading bay per 800-1,200m^2).

4.4.4 In order to cater for the potential demand of public transport services arising from the Proposed Development, a covered transport lay-by with 5 bus bays and 2 general lay-bys is been proposed. Subject to future liaison with the service provider, the covered transport lay-by will allow adequate hardware facility to serve the future public transport demand generated.

4.5 Implementation Programme

4.5.1 The Proposed Development is tentatively scheduled for completion by **Year 2031**.

5 VISUAL CONSIDERATIONS

5.1 A Visual Impact Assessment (VIA) has been conducted to assess the source and magnitude of the impacts of the Proposed Development on existing visual character and amenity in the context of the Application Site and its environs. The details of the VIA are provided in **Appendix C**.

5.2 A number of key public vantage points (VPs) have been selected to assess the overall visual impact of the Proposed Development. With reference to the analysis in preceding sections, and as illustrated on the photomontages taken at the selected VPs, the overall visual impacts of all VPs were mainly negligible / slightly adverse.

5.3 With incorporation of urban design considerations, such as appropriate landscape treatment, careful façade treatment, sensible building disposition and building separations to minimise façade length, it is considered that the Proposed Development would not bring about significant visual impact when assessed against the existing scenario.

5.4 In conclusion, the Proposed Development is fully acceptable in visual terms under the existing condition with the approved / planned developments (i.e. interim scenario), as well as the completion of another planning application for a comprehensive development to the immediate north of the Application Site (i.e. ultimate scenario).

6 TRAFFIC CONSIDERATIONS

6.1 A Traffic Impact Assessment (TIA) had been prepared in support of the Proposed Development. Details of the TIA are provided in **Appendix D**.

Junction and Road link Assessments

6.2 In order to review the existing traffic condition, traffic count surveys were conducted at 11 identified critical junctions to investigate the traffic condition during commuting peak hours. At present, all the critical junctions are operating within capacity.

6.3 The Proposed Development will result in a difference of 2-way traffic, with an increase of 89 pcu/hr and a decrease of 207 pcu/hr during the commuting AM and PM peak.

6.4 The Proposed Development is scheduled for completion in 2031 tentatively. Traffic forecast for design year 2034 was produced to assess the traffic impact arising from Proposed Development. The results of junction capacity assessments revealed that junctions except J10 and J14 would be able to handle the future traffic demand with all planned improvement works implemented.

6.5 Planned improvement measures were proposed to Fairview Park Interchange (J14) under Sha Po Public Housing Development. Additional junction improvement proposal to widen the approaching arms at Fairview Park Interchange (J14) is recommended to increase junction capacity. The performance of J14 would be improved and operating within capacity upon completion of the proposed improvement works.

6.6 The road link assessment results indicated that all the concerned road links are expected to operate within capacity except San Tin Highway (L14) and Tai Lam Tunnel (L15). With opening of future Route 11, it was anticipated that the traffic condition of both San Tin Highway and Tai Lam Tunnel could be significantly improved. Between the year 2031 (completion year of the development) and the opening year of Route 11 (i.e. year 2033), the V/C ratio of both San Tin Highway and Tai Lam Tunnel would reach 1.05 and 1.17 respectively, meaning that the traffic speed would be reduced, but would still be manageable with V/C ratio under 1.2.

Sensitivity Tests

6.7 It is noted that there is another planning application for comprehensive development with a total proposed domestic GFA of about 255,708m^2 to the immediate north of the Application Site. A sensitivity test has been carried out to assess the possible cumulative traffic impact. According to the assessment result, further junction improvement works would be proposed for the junction at Castle Peak Road – Tam Mi / Kam Pok Road East. With all planned / proposed junction improvement schemes to be timely implemented, all assessed junctions would be operated within capacity.

6.8 Another sensitivity analysis has been carried out to assess the traffic condition for the scenario without the aforementioned Sha Po Public Housing development and the corresponding junction improvements. With similar methodology adopted as discussed in the above section, 2034 traffic forecast for this sensitivity test is derived. Operational performances of the critical junctions are reassessed according to the revised traffic forecast and revealed that all the assessed junctions (except Castle Peak Road – Tam Mi / San Tam Road (J7) and Au Tau Interchange (J10)) would be able to handle the future traffic demand with all planned improvement works implemented timely.

6.9 Additional sensitivity tests were carried to assess the traffic impact induced by the potential private residential developments (such as planning applications no. Y/YL-MP/6, Y/YL-MP/7, Y/YL-MP/8, Y/YL-NTM/5 and Y/YL-NTM/6) which are situated in the vicinity of the subject development. The junction assessment results reveal that with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions would be able to handle the future traffic demand under Sensitivity Test Scenario.

6.10 In conclusion, the Proposed Development is technically feasible in traffic terms.

7 ENVIRONMENTAL CONSIDERATIONS

7.1 In order to evaluate the acceptability of the Proposed Development in terms of air quality, noise and other related environmental impacts, an Environmental Assessment (EA) Report has been prepared. For details of the report, please refer to **Appendix E** for consideration.

7.2 Potential industrial noise and emission, vehicular emission and railway noise impacts have been evaluated and considered acceptable, due to absence of industrial emission source within 200m from the Application Site, absence of aboveground railway system within 300m from the Application Site, remoteness and insignificance of industrial noise source, adequate separation maintained from carriageways meeting HKPSG requirement.

7.3 With agreement with the existing soy sauce factory operator, the existing soy sauce factory will be relocated to the southern part of the Application Site. Various design measures will be incorporated into the future relocated soy sauce factory, such as:-

1. A separate vehicular access will be reserved for the relocated soy sauce factory to connect with Castle Peak Road to minimise the any possible interfacing issues with the access of the future residents of the proposed residential development;

2. The future relocated soy sauce factory will be designed without any chimney stack to eliminate stack emission.

3. Operations that would generate odour will be housed indoor. Mechanical ventilation with deodorization units will be introduced;

4. The exhaust air louver will be located on southern façade of the relocated soy sauce factory which is away from the proposed residential development;

5. Any noisy facilities will be designed to meet HKPSG standard;

6. Proper drainage system and onsite wastewater treatment plant will be constructed to treat effluent to acceptable standard before discharge;

7. Concrete tanks will be covered with transparent plastic pane at all time except when collecting bean paste and not more than 3 concrete tanks will be opened at a time;

8. Commissioning testing will be conducted before the operation of the relocated Soy Sauce Factory after the deodorization units are installed if necessary;

9. Regular monitoring of the odour removal efficiency during operation stage may also be conducted to ensure the targeted odour removal efficiency could be achievable if necessary; and

10. If odour complaint is received, odour patrol will be conducted at the relevant ASR and the site boundary of the factory. Remedial actions shall be taken to rectify the odour problem if it is confirmed to be related to the operation of the factory.

7.4 The proposed Relocated Soy Sauce Factory will also be under column 2 of the proposed "R(E)" or "OU(I)" zone so that subsequent S16 planning application is required. If relevant Government Departments consider appropriate to review the design of the factory at subsequent detailed design and implementation stages, the Odour Impact Assessment can be further reviewed with further odour samples to be collected under different weather conditions and supplementary information of odour removal efficiency submitted to Government for review (e.g. under S16 planning application).

7.5 With implementation of the above recommended design measures, no insurmountable environmental noise, air quality and water quality due to the future operation of the soy sauce factory is anticipated.

<u>Residential Portion and Reserved School Site</u>

7.6 The proposed residential use itself is generally non-environmental polluting in nature. No chimney stack would be erected. The proposed Covered Transport Lay-by will be designed with the exhaust louver facing road and away from any air sensitive receiver of the proposed residential development. In fact, there is no nearby air sensitive uses close to the tentative exhaust louver location, as such significant air quality impact due to the operation of the covered bus lay-by is not anticipated.

7.7 The potential road traffic noise impact on the Proposed Development has also been assessed quantitatively. Noise mitigation measures in terms of orientation, self-protecting building design (including blank wall), acoustic window / door (baffle type), and fixed glazing (with or without maintenance window) have been proposed. With the recommended noise mitigation measures in place, no significant road traffic noise impact on future residential dwellings is envisaged.

7.8 Regarding the Reserved School Site, the orientation of the future primary school would be carefully designed to avoid facing towards road directly. Air conditioning and better insulation would be recommended as the last resort.

7.9 Fixed noise impact assessment has also been conducted. The assessment result demonstrates that the predicted noise levels at selected NSRs comply with the relevant noise criteria and no at-receiver noise mitigation measure is required. It is understood that there will be potential air conditioner outdoor units proposed for clubhouse, mechanical ventilation for car park and covered transport lay-by, etc. It is noted that the detailed design is subject to fine tuning and after respective contractors engaged. To avoid adverse noise impact on the surrounding NSRs, the future contractor shall ensure that the equipment within the Proposed Development would be designed and installed to meet the HKPSG criteria.

Possible Impacts at Construction Stage

7.10 Potential environmental impacts arising from construction activities of the Proposed Development, including air quality, construction wastewater, noise and waste impacts have been qualitatively assessed. No insurmountable environmental impacts are anticipated with the implementation of environmental mitigation measures.

7.11 Based on the preliminary review at this rezoning stage, it is noted that the Application Site should have been used for soy sauce manufacturing & storage and containers open storage. Compressed gas, construction tools, abandoned wood, generators, oil stains were identified in the open storage area at grade. Potential land contaminating problems were considered possible onsite. The land contamination assessment is required and remediation (if necessary) shall be completed before development works at the Application Site.

7.12 In conclusion, there is no unacceptable environmental noise, air quality, water quality, odour and waste impacts anticipated on or arising from the proposed development with the recommended environmental mitigation measures properly implemented.

8 DRAINAGE, SEWERAGE AND WATER SUPPLY CONSIDERATIONS

8.1 Assessment Methodology

8.1.1 It is noted that there is another planning application for a comprehensive development located to the immediate north of the Application Site with a total domestic GFA of about 255,708m^2. In order to assess the cumulative impact of the two Proposed Developments, the development parameters proposed under the two planning applications have been included in this assessments to present the full picture in a holistic manner for better infrastructural planning.

8.2 Drainage Impact Assessment

8.2.1 To assess the potential drainage impact as a result of the Proposed Development, a Drainage Impact Assessment (DIA) had been carried out. Please refer to **Appendix F** for consideration.

8.2.2 The drainage impact due to the change of drainage characteristics (e.g. change in surface runoff due to increase in the unpaved area) had been assessed. Climate change and sea level rise are also considered in accordance with Stormwater Drainage Manual. Upon completion of the Proposed Development, a reduction in drainage discharge to Kam Tin River is anticipated.

8.2.3 It is proposed that the stormwater surface runoff will be collected by internal drainage pipe network as well as perimeter drains along the site perimeter. The proposed drainage system discharges a portion of surface runoff to the proposed box culvert. The proposed box culvert discharges to Historical Kam Tin River and eventually discharge to Trained Kam Tin River via existing 3x900mm pipes.

8.2.4 The remaining portion of surface runoff will be discharge to the existing outfall structure. The net discharge flow to the outfall structure will be decreased and discharged to the Trained Kam Tin River (i.e. Kam Tin Channel) via the existing twin cells 5.25m(W) × 3.84m(H) box culvert.

8.2.5 The stormwater from the relocated Soy Sauce Factory and the Reserved School Site will be discharged to existing drainage outfall structure at the southern boundary. In addition, the treated effluent from the relocated Soy Sauce Factory will also be discharged through stormwater system. The amount of treated effluent discharge would be the same as the existing soy sauce factory. Hence, no adverse impact to the stormwater system will be expected.

8.2.6 Based on the hydraulic assessment, there is no significant drainage impact on the surrounding drainage system arising from the Proposed Development.

8.3 Sewerage Impact Assessment

8.3.1 To assess the potential sewerage impact as a result of the Proposed Development, a Sewerage Impact Assessment (SIA) had been carried out. Please refer to **Appendix G** for consideration.

8.3.2 The sewage generated from the proposed residential development will be conveyed to the proposed terminal manhole (located at the western edge of the site. It will further drain to the existing gravity sewers along Pok Wai South Road, discharging to existing Nam Sang Wai Sewage Pumping Station (NSWSPS) and ultimately to Yuen Long Sewage Treatment Works (YLSTW).

8.3.3 The sewage generated from the proposed primary school and relocated soy sauce factory will be discharged to proposed sewer manhole (MH01) via rising main, conversion chambers and a series of 225mm dia. gravity sewer.

8.3.4 The sewage generated from the proposed Residential Development will be discharged proposed sewer manhole (MH04) via a 450mm dia. gravity sewer.

8.3.5 A series of 450mm dia. to 600mm dia. gravity sewer will be proposed to convey the sewage upstream from "OU(CDWRA)1" and "R(E)" sites, relocated soy sauce factory and reserved school site to existing manhole FSH1001880 at Pok Wai South Road to NSWSPS and ultimately discharge to YLSTW.

8.3.6 The existing DN1200 downstream gravity sewer connecting existing public manhole FSH1001880 and NSWSPS is considered adequate as there is no significant sewerage impact due to sewage discharge from SPSPS, KTSPS and proposed residential development to the immediate north including GIC facilities under Planning Application No. Y/YL-NSW/8.

8.3.7 The assessment report also shows that the NSWSPS, YLSTW and YLEPP will have adequate capacity to cater for the design sewage flow.

8.4 Water Supply Impact Assessment

8.4.1 To assess the potential impact on water supply as a result of the Proposed Development, a Water Supply Impact Assessment (WSIA) had been carried out. Please refer to **Appendix H** for consideration.

8.4.2 According to Water Supplies Department's record plan, there is an existing 700mm diameter fresh water main underneath San Tam Road and an existing 200mm diameter fresh water main underneath Castle Park Road – Tam Mei while no salt water supply system in the vicinity of the Application Site. The demand for flushing water would be met by using fresh water. Temporary fresh water main for flushing (TMF) is applied for the Proposed Development. It is recommended that connection of salt water supply system is to be provided to the Proposed Development when it is available.

8.4.3 The existing 80mm diameter and 50mm diameter fresh water distribution main inside the Proposed Development would be abandoned and diverted. Such diversion avoids the potential disturbance in water supply to a number of existing temporary sheds.

8.4.4 The existing 700mm diameter fresh water main along San Tam Road is proposed to tee off by a 400mm diameter fresh water main. The proposed 400mm diameter water main will then be separated into a 300mm diameter water main for fresh water supply and a 150mm diameter water main for flush water supply. About 13% capacity of the existing 700mm diameter fresh water main would be utilised.

8.4.5 The existing 200mm diameter fresh water main along Castle Peak Road - Tam Mi will be extended by about 50m towards the access road of the Application Site. The 200mm diameter fresh water main is proposed to tee off to a 80mm diameter water main for the relocated soy sauce factory fresh and flush water supply, while the fresh and flush water supply of the reserve school site will be served by another 80mm diameter water main. About 19% capacity of the existing 200mm diameter fresh water main would be utilised.

8.4.6 Considering the possible cumulative impacts of the two planning applications, the overall estimated water demand is approximately 10,757.54m^3/day in total, which would not exceed the capacity of the existing 700mm diameter fresh water main along San Tam Road, with only up to 41% capacity of the existing 700mm dia. fresh water main would be utilised.

8.4.7 The Proposed Development under this rezoning application is technically feasible from water supply point of view.

9 ECOLOGICAL CONSIDERATIONS

9.1.1 To evaluate the ecological impacts with the Proposed Development in place, an Ecological Impact Assessment (EcoIA) has been conducted. Please refer to **Appendix I** for consideration.

9.1.2 Within the Application Site, developed area, plantation and wasteland will be lost directly. Due to the very low or low ecological values of these habitats, the potential impact due to loss of those habitats is considered insignificant.

9.1.3 This EcoIA demonstrates that the proposed development would not have significant disturbance impacts to the surroundings including wetlands inside WCA, and will not affect the buffer functions of the WBA, and is thus in line with the Town Planning Board Guideline No. 12C (TPB Guideline No. 12C) "Application for Developments within Deep Bay Area".

9.1.4 Fragmentation of habitats may occur during construction phase, resulting in loss of ecological linkages between patches of habitats or habitats assemblages, especially in cases where construction of the development cuts through one habitat or between two areas of similar habitat with significant migration of fauna. The Application Site is currently dominated by habitats with low and very low value, and the areas to its north, northeast, east and south directions are also mostly wastelands, developed areas or roads/highways. Movement of non-volant fauna (e.g. mammal, herpetofauna) through the Application Site is therefore limited under the existing condition due to the low value habitats, fence along the site boundary, as well as roads/highways to the east of the site. Hence, the potential impact due to habitat fragmentation is ranked as insignificant.

9.1.5 For birds, in particular waterbirds, due to the lack of sizable wetland habitat within the Application Site suitable for species that normally occur in significant numbers in Inner Deep Bay (larger ardeids, ducks, waders, Black-faced Spoonbill), the waterbird usage in the Application Site was low as described above. In addition, as the Application Site is at the fringe of the Deep Bay wetland area, with no significant areas of wetland to the north, northeast, east and south directions, it is not likely to have considerable ecological linkages with the Inner Deep Bay wetland area, or to be utilised by waterbirds to access their suitable wetland habitats. Hence, it is considered that indirect impacts (loss of ecological linkage) on the Inner Deep Bay wetland ecosystem as a result of this development would be negligible.

9.1.6 In accordance with the flight observations recorded during the ardeid breeding season in 2019 and 2020, after taking off from Tung Shing Lane Egretry, the majority of ardeids flew along a general northward direction (flying across Yuen Long Highway and the Yuen Long Bypass Channel) with much smaller number flying eastward to Kam Tin River and westward to Yuen Long Town directions. For the breeding ardeids flying towards northern direction, after passing Yuen Long Highway, the majority of flight directions were towards Kam Tin River i.e. 39.22% and 58.33% in 2019 and 2020, respectively. None of the flight-lines passed through the Application Site. Other studies also reported ardeids have the tendency to follow waterways to reach their feeding grounds (see AEIAR-175/2013 & AEIAR-215/2017). In fact, TSL Egretry was abandoned in 2021. Potential impacts to the flight-line of breeding ardeids are therefore not expected.

9.1.7 For other detailed analysis of the direct impacts and indirect impacts induced by the Proposed Development, please refer to **Appendix I** for consideration.

9.1.8 In summary, the Proposed Development under the subject rezoning application is technically feasible in ecological terms.

10 AIR VENTILATION CONSIDERATIONS

10.1.1 An Air Ventilation Assessment has been conducted to assess the potential air ventilation impact of the Proposed Development on future pedestrian wind environment. The details of the AVA are provided in **Appendix J**.

Assessment Methodology

10.1.2 The air ventilation performance has been evaluated by comparing the Proposed Development with the previous approved development proposal (Application No. Y/YL-NSW/3), which was in support of a hotel cum shopping mall development with a maximum plot ratio of 1.5 and a maximum building height of 10 storeys (above ground) on the southern portion of the Application Site. Another previous approved planning application situated to the immediate north of the Application Site in the "OU(CDWRA)" zone (Application No. A/YL-NSW/241), which was for a proposed comprehensive development of an outlet mall with commercial uses n the Application Site, has also been taken into account in the AVA.

10.1.3 It is noted that there is another planning application for comprehensive development with a total domestic GFA of about 255,708m^2 to the immediate north of the Application Site (Application No. Y/YL-NSW/8). Two development scenarios (i.e. with or without this proposed comprehensive development under separate submission) have been assessed in the AVA.

10.1.4 The Assessment Area is determined by the height (H) of the highest building within the Assessment Area (i.e. The Proposed Development with a maximum building height of about 110 m) and usually covers an area of 1H from the site boundary as required in Technical Guide. In order to assess the cumulative impact on the pedestrian wind environment with the presence of the proposed developments of Y/YL-NSW/8 and Y/YL-NSW/9, the Assessment Area and Surrounding Area are extended to 1,000m and 2,000m respectively.

Assessment Results

10.1.5 According to the quantitative assessment result, the modelling results show that the wind performance at the pedestrian level of the area around the Application Site with completion of the Proposed Development together with the proposed comprehensive development situated to the north of the Application Site would be comparable to the approved development scenario under Application Nos. A/YL-NSW/241 and Y/YL-NSW/3.

10.1.6 In particular, the provision of building separations within the building blocks within the Application Site as well as along the northern site boundary would facilitate wind penetration and performance at local areas under annual wind condition. For examples, for the area situated in between of the two proposed developments and areas along San Tin Highway, the air ventilation performance would be enhanced under annual and summer wind conditions when comparing against the approved development scenario under Application Nos. A/YL-NSW/241 and Y/YL-NSW/3.

10.1.7 In conclusion, the Proposed Development with proposed rezoning is considered acceptable from air ventilation perspective.

11 RISK CONSIDERATIONS

11.1.1 A Quantitative Risk Assessment has been prepared to assess the potential risk posed by the high pressure town gas pipeline in the vicinity on the Proposed Development. Mitigation and other protection works, if required, would be proposed to ensure compliance with the risk guidelines as described under Chapter 12 of Hong Kong Planning Standards and Guidelines (HKPSG).

11.1.2 Key study findings are summarised below:

Individual Risk

- The individual risk contours of 1E-08 and 1E-09 per year were identified for the existing high pressure town gas pipeline (HPTGP) and within the proposed study zone. The predicted individual risk level is well below the individual risk criterion as 1E-05 per year from Hong Kong Risk Guidelines.

Societal Risk

- The societal risk for Operational Phase (2031) of the Application Site is within "Acceptable" region based on Hong Kong Risk Guidelines.

11.1.3 It could be concluded that the individual risk and societal risk associated with the existing HPTGP are in compliance with Hong Kong Risk Guidelines. As such, no further mitigation measures are required.

11.1.4 The assessment of the risks posed by the existing high pressure town gas pipeline (HPTGP) running along San Tam Road in the vicinity of the Application Site during operation phase (i.e. Year 2031) are therefore in compliance with Hong Kong Risk Guidelines. For details, please refer to **Appendix K** for consideration.

12 REZONING JUSTIFICATIONS AND MERITS

12.1 Complementary to the Latest Strategic Planning Framework

12.1.1 With an overall vision from the Government to developing the Northern Metropolis into a metropolitan area good for people to live in, work and travel, it is expected that there will be ample opportunities for housing, technology development and other industries in the Northern New Territories.

12.1.2 According to Northern Metropolis Action Agenda issued by the Government in October 2023, the Northern Metropolis will be divided into four major development zones given the characteristics and strengths of different areas. The Application Site is situated within one of the four major development zones (i.e. Innovation and Technology Zone). The focus development of this zone is the San Tin Technopole, which not only acts as the core of industrial development in the Northern Metropolis, but also intended to become a liveable town with comprehensive community facilities. It will become an International I&T hub, with unique metropolitan landscape marked with "Urban-Rural Integration and Co-existence of Development and Conservation".

12.1.3 To act in a forward-planning perspective, the Applicant has proactively review the development potential of the Application Site and formulate a development proposal that integrate residential development within re-industrialization of the Soy Sauce Factory. The subject development proposal is able to not only contribute to housing supply in the short run, but also act as a catalyst to phase out the surrounding open storage and port back-up uses for the development of the Northern Metropolis.

12.2 Harnessing the Enhanced Infrastructure Capacity of the Planned Traffic Infrastructure to Unleash Development Potential

12.2.1 According to the Northern Link (NOL) Project Profile prepared by the MTR Corporation Limited (MTRCL), the NOL will form railway loop in the northern new territories that drives land and economic development along the alignment. With the construction of the NOL scheduled to commence in 2025 and complete in 2034. Since the planned Au Tau Station is located at about 150m away to the immediate east of the Application Site, the development potential of the Application Site can be enhanced by the increased transport capacity brought by the NOL.

12.2.2 In terms of road traffic, the Secretary for Transport and Logistics recently updated that the government will seek funding approval for the investigation works for the NM Highway shortly, whereas the construction works are targeted to commence by 2028. The San Tin Section of this strategic highway, which is in close proximity to the Application Site, is promulgated and scheduled for opening in or before 2036. The subject rezoning application is also well in line with the infrastructure-led approach advocated by the Government.

12.2.3 The Proposed Development would also become a key driver in catalysing the developments along the NOL alignment and within the station catchment of Au Tau Station. With a target completion year of 2031, as demonstrated by the supporting TIA, the Proposed Development would be sustainable in traffic terms prior to the operation of the NOL. A sizeable population within the railway catchment lays the foundation for the viable and sustainable operation of the NOL in its early years of operation, which is expected to be in operation starting from Year 2034. A sizeable population within the railway catchment lays the foundation for the financially viable and sustainable operation of the NOL and Northern Metropolis Highway in its early years of operation, which is expected to be in operation starting from Year 2034 to 2036 onwards.

12.3 An Anchor Housing Development to Alleviate the Acute Housing Shortage

12.3.1 In terms of the demand of residential units in the Northern New Territories, as mentioned in Section 3.2 above, it is estimated that the total planned population would be about 165,600 persons. The planned 217,000 employment opportunities within the San Tin Technopole will likely to generate huge demand on providing the required supporting housing units for themselves and their families. Comparing to the planned 54,000 residential units as planned under the San Tin Technopole, it is foreseeable that there will be a huge gap between demand and supply of the housing units around the San Tin Technopole.

12.3.2 The Application Site is situated in an area, which enjoys good rail network and road link connections with the San Tin Technopole. Not only will the Proposed Development have the capacity to serve the rising needs of Hong Kong people working in the Northern Metropolis who are looking for more convenient and quality living, it will also be able to accommodate a sizeable population serving as an anchor housing development to support the sustainable development of the San Tin Technopole. The Proposed Development under the current application could

play a vital role in the region to achieve home-job balance and reduce the need for daily cross-district commuting.

12.3.3 In terms of provision of the much-need private housing residential units to meet our long-term housing supply target, by echoing with the views as suggested by the Our Hong Kong Foundation, the Government's 10-year housing supply target is too conservative to make up for the cumulative shortfall. Together with the other planning application to the immediate north of the Application Site which proposes about 6,825 private housing units, the two development proposals could effectively contribute to the medium- to long-term housing private housing supply with a target completion year of 2031.

12.4 Compatible with the Changing Land Use Planning Context in the Vicinity

12.4.1 Situated adjacent to the northeast of Yuen Long New Town, in addition to the high-density and high-rise residential developments around the Yuen Long Station, a cluster of existing development as well as planned / committed developments are situated in close proximity to the Application Site:

- Sha Po Public Housing Development with PR of 6.7 and BH of 52 storeys (185mPD);

- Land Sharing pilot Scheme No. 002 at Ho Chau Road for a comprehensive public/ private housing development. The development has a PR of 4.45 and 2.16 for the public housing and private housing portion respectively as well as a BH of 26 storeys (100mPD);

- Low to medium-rise developments to its southeast in Kam Tin (i.e. Park YOHO and Riva) with a PR of below 2 and BH of 16-18 storeys (60-70mPD); and

- Planning application (No. A/YL-KTN/964) for a private residential development about 900m southeast of the Application Site with a PR of below 2 and BH of 17 storeys (65.93mPD) was approved by the Board on 15.3.2024; and

- Another planning application (No. Y/YL-NSW/7) for a private residential development about 100m north of the Application Site within the Wetland Buffer Area and closer to the NSW WCPs System with a PR of 1.548 and building height of 15 storeys (54mPD) was approved by the Board on 10.11.2023

12.4.2 In view of the above recent development context, it is obvious that the area where the Application Site is located is a logical urban extension of the Yuen Long New Town. In terms of development compatibility, the Proposed Development with a total domestic GFA of about 115,942m^2 and a building height of not more than 115mPD is compatible with the surrounding development context. The Application Site is also located in a transitional zone between the Sha Po Public Housing Site to the east and existing ponds to the west and northwest. Upon completion of the Proposed Development, the subject medium-density development can serve as an effective visual transition between the public housing development and the rural context.

12.5 In Line with the Government's Intention for Releasing Development Potential in WBA

12.5.1 As mentioned in Para. 3.3.4, the plot ratio of the some existing developments are already ranging from 1.5 to 4.45 within the WBA. For example, the completed residential developments Wetland Seasons Bays and Wetland Seasons Park are located at the fringe of WBA and adjacent to the Hong Kong Wetland Park. Both developments have a PR of 1.5 and a BH of 10 storeys (>40mPD). Additionally, the Land Sharing Pilot Scheme No. 002 at Ho Chau Road has a PR of 4.45 and 2.16 for public housing and private housing portion respectively as well as a BH of 26 storeys (100mPD). Also, another private residential development located to the further north of the Application Site and closer to the NSW WCPs System was approved by the Board on 10.11.2023. This shows that there are desirable precedent for housing development within WBA, which act as transition from densely populated and built up areas to wetland habitats.

12.5.2 By phasing out the existing container storage uses and relocating the existing soy sauce factory to the southern portion of the Application Site away from existing wetland. The Proposed Development would effectively act as a buffer and minimise any possible ecological nuisances on the wetland to the further northwest of the Application Site. In this sense, the subject rezoning application is considered to adhere to the guiding principle under NMDS by promoting "Urban-Rural Integration and Co-Existence Of Development and Conservation" to meet the overall development needs of Hong Kong.

12.6 Respecting the Planning Requirements of the TPB-PG No. 12C

12.6.1 The Application Site is paved and developed, with a portion of it being occupied by the existing soy sauce factory. It also does not contain any wetland habitat or areas with significant ecological value that has to be retained in its present form or require any compensation for any direct habitat loss.

12.6.2 The existing site condition of the Application Site satisfies the criteria as set out in the TPB PG-No. 12C, which states that the degraded area with presence of open storage use can be considered as target areas to allow an appropriate level of residential development so as to provide an incentive to remove the open storage use and to restore some of the ecological value lost throughout the years.

12.6.3 As a whole, according to the findings of the Ecological Impact Assessment, there will be no net increase of pollution loading to the Deep Bay Area and would not have negative off-site disturbance impact on the ecological value of fish ponds.

12.7 Echo with the Government's Policy Directive to Promote Re-industrialization (also known as Industry 4.0) and Improvement to Existing Environment through Comprehensive Residential Development and Relocation of Existing Soy Sauce Factory

12.7.1 The Government has been advocating re-industrialisation (also known as Industry 4.0) which aims to revitalise and modernise traditional industries since the initiative was first released in the 2016 Policy Address. Within the Application Site, there is an existing factory which is one of the renowned traditional sauce factories in Hong Kong. By actively being a manufacturing factory for years, its existing structures impose limitations of further upgrading certain facilities.

12.7.2 The Applicant now proposes to relocate the existing Soy Sauce Factory to the southern tip with a further distance away from Deep Bay. After relocation, the soy sauce factory will be upgraded and modernised into a more environmental-friendly premise, which renders the opportunity to optimise the development potential for the remaining area within the Application Site for development of a compatible residential development. With active coordination and preliminary agreement with the operator of the existing Soy Sauce Factory owner on-site, the Proposed Development can contribute to rationalise the spatial planning of the ageing neighbourhood to a more integrated community in the area.

12.7.3 Successful case references with compatible residential and industrial development can be found in Hong Kong. Making reference to the developments of Ocean Pointe, Bellagio and The Garden Bakery Factory Buildings in Sham Tseng, it is feasible to have residential developments adjacent to industrial development in both planning and technical perspectives. Please find a short summary as follows.

Case Study:

Bellagio + Ocean Pointe + Garden Bakery's Factory Buildings, Sham Tseng

Year 1930s to 1990s	The site of where Bellagio is situated at was used to be a brewery (i.e. Former San Miguel Factory) The site of where Ocean Pointe is situated at was used to be for chemical storage, warehousing and materials manufacturing (i.e. Former Union Carbide Depot)
Year 1994 to 1995	The former Union Carbide Depot was relocated to Mainland China and the site was sold to a developer. Subsequently, a S16 planning application for comprehensive residential development at then CDA site was approved **with Former San Miguel Factory on the West while the Garden Bakery's Factory in the east which was still in operation at the time of approval**.

Year 1996	The former San Miguel Factory site was sold to a developer and the factory ceased its operation. **A S16 planning application for comprehensive development of commercial and residential uses at the then CDA site was approved with the Garden Bakery's factory in the east is still in operation.**
At present	The Garden Bakery's Factory is still in operation. Respective development sites for Bellagio and Ocean Pointe have been rezoned into "R(A)2" and "R(A)3" respectively.

12.8 Carefully Formulated Development Proposal with Planning Gains and Design Merits

12.8.1 In formulating the rezoning proposal, much efforts have been paid to bring forth planning merits and gains to the area to benefit the local community.

12.8.2 With a tentative completion year of 2031, the Proposed Development would be able to provide of about 3,115 nos. of residential units to support the future growth of the Northern Metropolis and extension of Yuen Long New Town.

12.8.3 In terms of supporting the neighbouring community, the Proposed Development would reserve a site for a potential primary school. Ancillary commercial facilities and covered transport lay-by would also be provided to serve the daily needs to the future population in the area.

12.8.4 A stepped building height profile has been incorporated in the indicative development scheme. The proposed building height profile will be generally descending from 29 storeys (about 115mPD) from the Castle Peak Road and the planned high-rise Sha Po Public Housing Development in the east to 15 storeys (about 61.5mPD) towards the west to respect the Kam Tin River and other water bodies in the west. The stepped building height profile is able to preserve the visual interest while minimising the potential visual impact on the surrounding.

12.8.5 To promote wind penetration and enhance visual permeability, the proposed building blocks are generally arranged in east-west orientation with the development clusters setting back from the boundary abutting the "OU(CDWRA)" zone. Building separations of more than 15m are also allowed in between residential development clusters to promote wind permeability.

12.8.6 In landscape terms, buffer planting will be provided along the northern and eastern site boundaries to serve as planting and amenity strip to uplift the landscape environment. In particular, a landscape and communal garden will be provided along the northern portion of the residential portion to act as a visual and amenity buffer against the "OU(CDWRA)" zone to the north.

12.9 Application Site is Readily Available for Development

12.9.1 With the consensus with the owner of the Soy Sauce Factory, the private lands within the Application Site are largely secured under the Applicant's ownership and the owner of Soy Sauce Factory. As such, the Proposed Development could be implemented in a timely manner in terms of relocating the Soy Sauce Factory and develop the residential portion in the Application Site.

12.10 Proposed Development is Technically Feasible

12.10.1 Various technical aspects such as landscape, visual, traffic, environmental, drainage, sewerage, water supply, ecological, air ventilation and potential risk impacts of the project have been duly considered and it is concluded that there would be no insurmountable problems due to the Proposed Development.

12.10.2 The Application Site is mostly paved and currently used as a Soy Sauce Factory and a Temporary Container Storage Yard. An Ecological Impact Assessment prepared under the subject application and concluded that the Proposed Development is in line with the TPB PG-No. 12C as ecological impacts arising from the Proposed Development would be insignificant.

13 CONCLUSION

13.1 This S.12A rezoning application is submitted to the TPB for rezoning the Application Site covering Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D. 107 and adjoining Government Land, West of Castle Peak Road – Tam Mi, Yuen Long, from the current "I(D)", "OS" and 'Road' zones under the Draft Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9 to a new "R(E)" zone, in support of a comprehensive development comprising a residential development, a reserved school site and a relocated soy sauce factory.

13.2 In support of the above proposed planning intention, an indicative development proposal has been prepared. Under the proposed indicative scheme, the northern portion of the Application Site will be proposed to be a medium-density comprehensive development with residential and supporting commercial and ancillary uses. With a domestic GFA of about 115,942m^2, this portion of the Proposed Development consists of 11 residential towers ranging from 15 to 29 storeys with building heights of not more than 115mPD, offering a total of 3,115 residential units. There will also be retail and transportation facilities serving the future community.

13.3 The southern portion of the Application Site will be for the future operation of the relocated existing soy sauce factory. To cater for the potential educational need of the future population in the area, a primary school site has been reserved within the Application Site. The reserved school site will be formed by the Applicant and to be handed back to the Government upon site formation as necessary.

13.4 The subject application is supported on the following grounds:

- The subject rezoning application is complementary to the strategic planning framework;
- The subject rezoning application can harness the enhanced infrastructural capacity brought by the planned traffic infrastructures and unleash the development potential of the Application Site;
- The rezoning proposal is in line with the Government's endeavours in enhancing housing land supply;

- The Proposed Development can serve as an anchor housing development to alleviate the acute housing shortage;

- The development intensity of the Proposed Development is compatible with the changing land use planning context in the vicinity;

- The subject rezoning application is in line with the Government's Intention for releasing development potential in WBA;

- The subject rezoning application respects the planning requirements under TPB-PG No. 12C;

- The subject rezoning application echoes with the Government's policy directive of promoting re-industrialization (as known as Industry 4.0) and will greatly improve the quality of the existing environment through comprehensive residential development and relocation of the existing soy sauce factory within the Application Site;

- The Proposed Development is carefully formulated with planning gains and design merits;

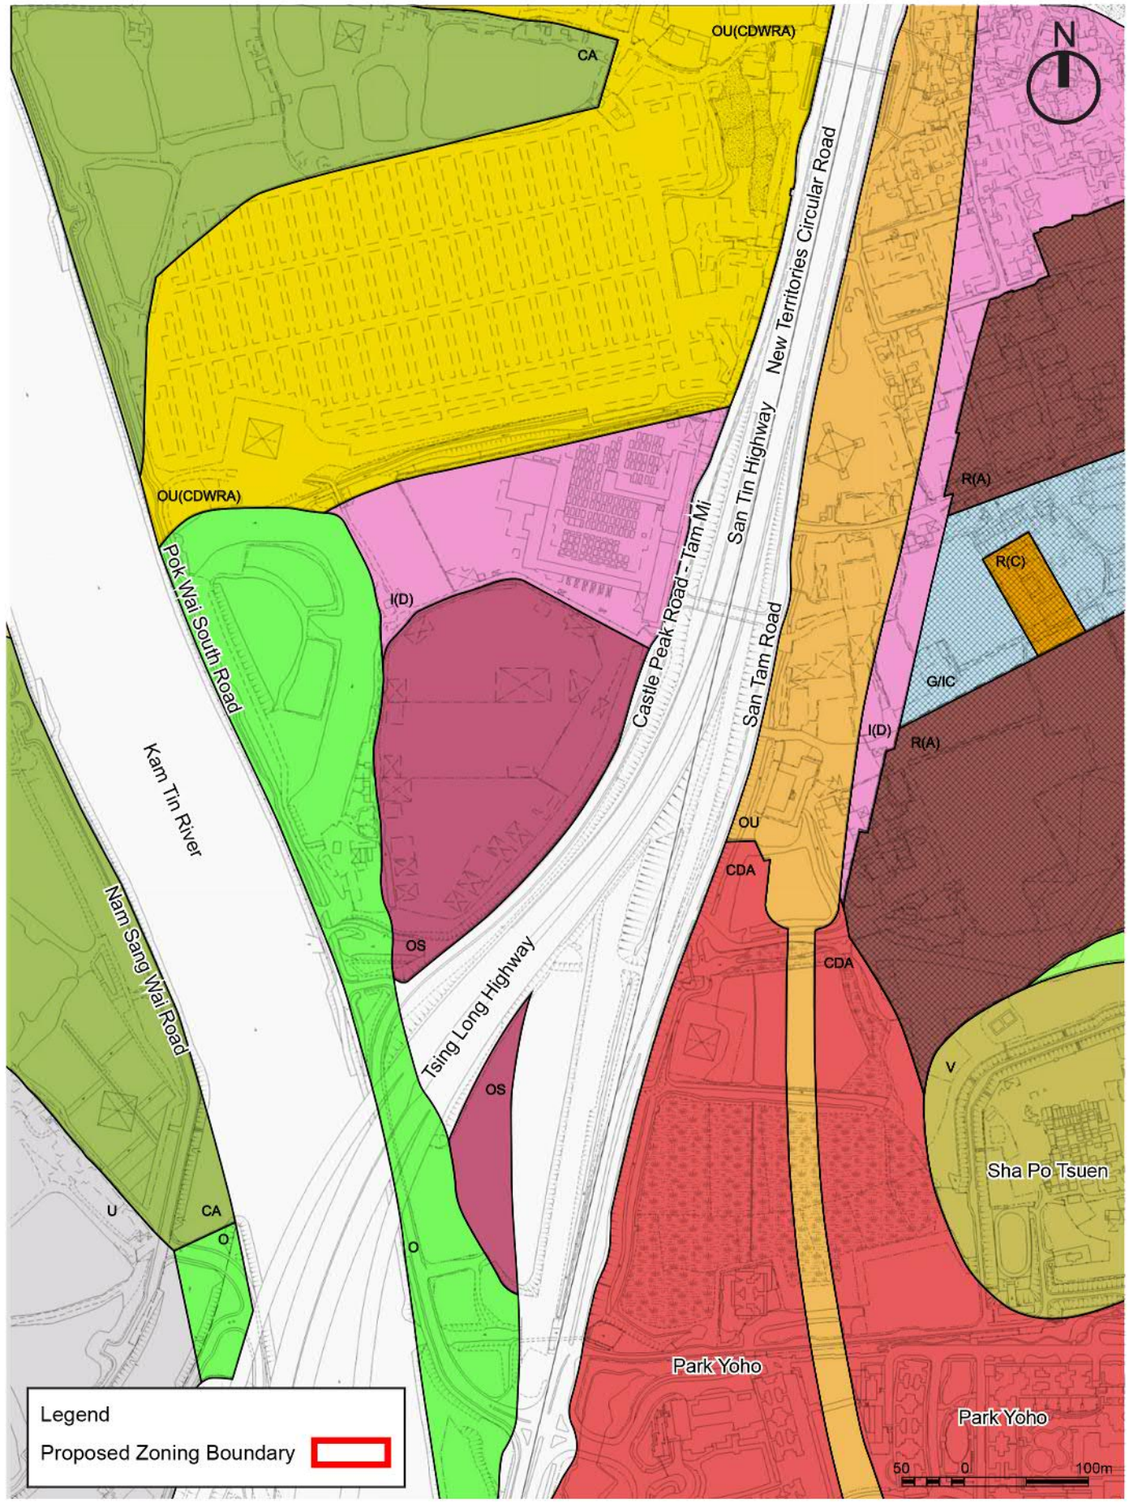
- Largely secured land holding status with consensus with the owner of the soy sauce factory can warrant timely implementation of the Proposed Development; and

- There is no insurmountable problem due to the Proposed Development from technical aspects.

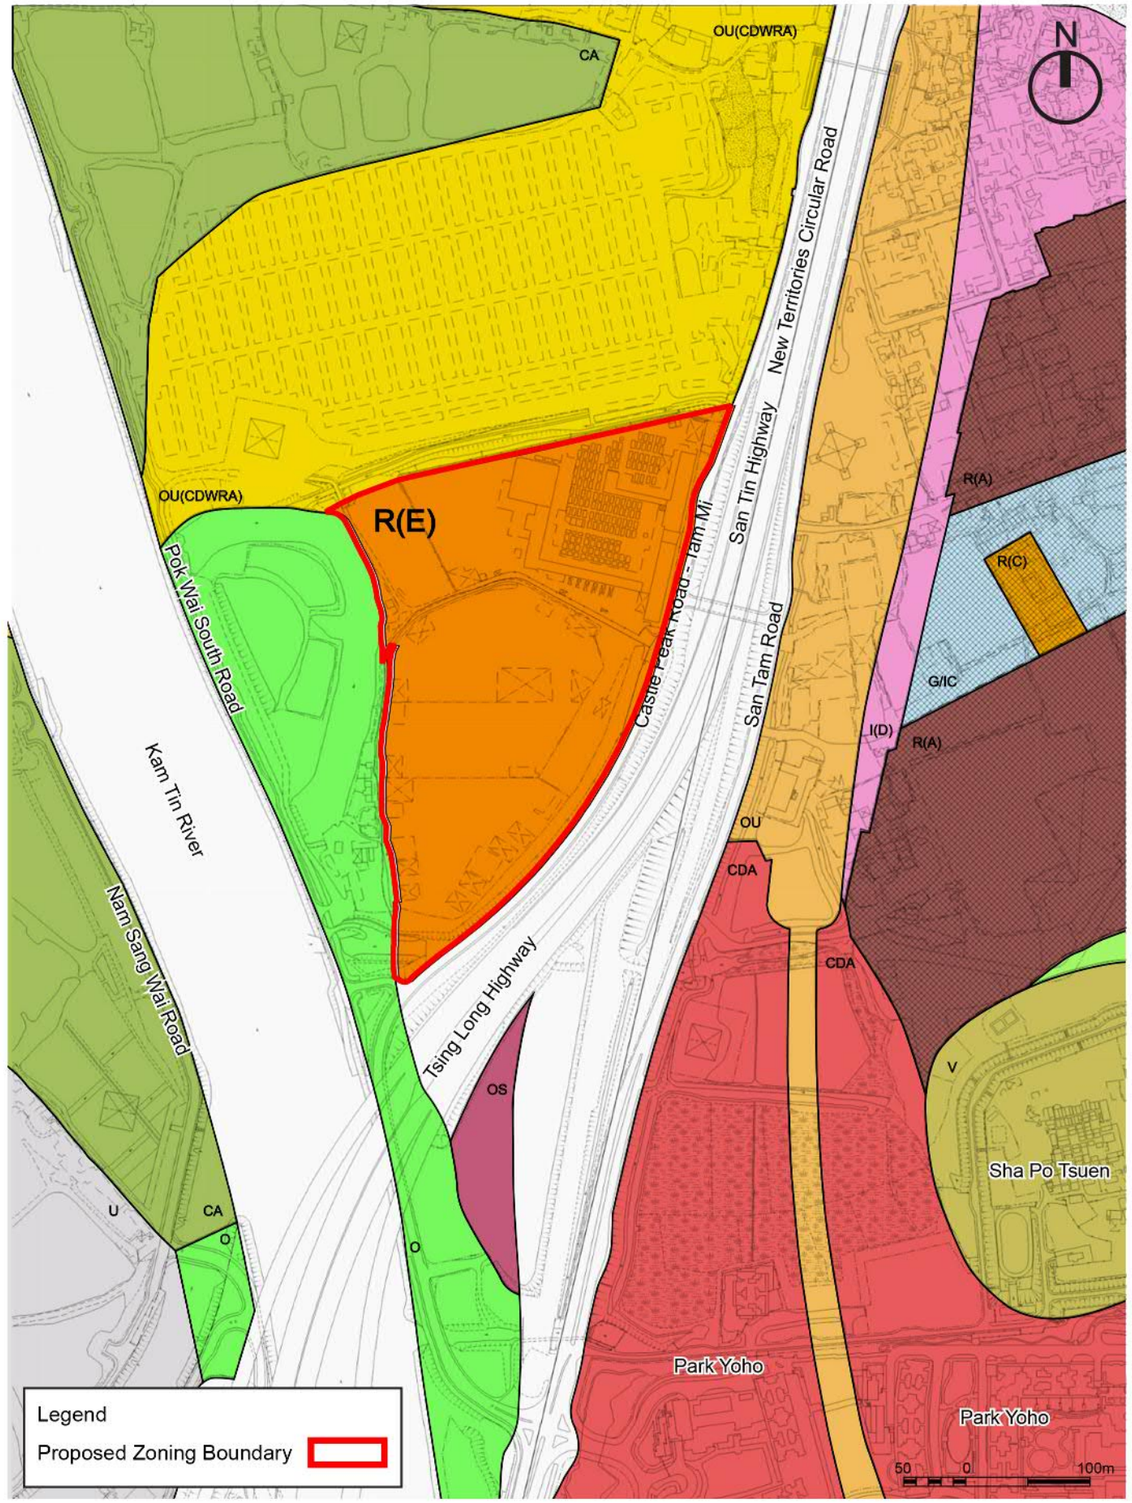
13.5 In light of the justifications presented in this Planning Statement, the TPB is cordially invited to consider this rezoning application favourably.

Appendix A1

Proposed Amendments to the Plan, Notes and Explanatory Statement of the Draft Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9 (Original Option)



Original Zoning



Proposed Zoning

llewelyn davies

Title

Proposed Amendments to the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/9
(Original Proposal)

Checked	DH	Drawn	PW
Rev	0	Date	Feb 2025
Scale		Figure	A1

Proposed Schedule of Uses for "Residential (Group E)"

RESIDENTIAL (GROUP E)
(for rural areas only)

Column 1 Uses always permitted	Column 2 Uses that may be permitted with or without conditions on application to the Town Planning Board
Schedule I: for open air development or for building other than industrial building	
Ambulance Depot Government Use (Police Reporting Centre, Post Office only) Rural Committee/Village Office Utility Installation for Private Project	Eating Place Educational Institution Flat Government Refuse Collection Point Government Use (not elsewhere specified) ***Hotel*** House (other than rebuilding of New Territories Exempted House or replacement of existing domestic building by New Territories Exempted House permitted under the covering Notes) Institutional Use (not elsewhere specified) Library Office Petrol Filling Station Place of Recreation, Sports or Culture Private Club Public Clinic Public Convenience Public Transport Terminus or Station Public Utility Installation Public Vehicle Park (excluding container vehicle) Recyclable Collection Centre Religious Institution Residential Institution School Shop and Services Social Welfare Facility Training Centre

(Please see next page)

Column 1 Uses always permitted	Column 2 Uses that may be permitted with or without conditions on application to the Town Planning Board

Schedule II: for existing industrial development (including relocation of existing industrial development falling within the same "R(E)")

Eating Place (Canteen only)	***Industrial Use***
Government Refuse Collection Point	Office
Government Use (not elsewhere specified)	Petrol Filling Station
Public Utility Installation	Public Convenience
Recyclable Collection Centre	Public Vehicle Park (excluding container vehicle)
Rural Workshop	Shop and Services (ground floor only)
Utility Installation for Private Project	Vehicle Repair Workshop
Warehouse (excluding Dangerous Goods Godown)	Wholesale Trade

Planning Intention

This zone is intended primarily for phasing out of existing industrial uses through redevelopment for residential use on application to the Town Planning Board. Whilst existing industrial uses and relocation of existing industrial development falling within the same "R(E)" zone will be tolerated, new industrial developments are not permitted in order to avoid perpetuation of industrial/residential interface problem.

(Please see next page)

Remarks

(a) In determining the maximum gross floor area and building height for uses under Schedule I above, no new development, or addition, alteration and / or modification to or redevelopment of an existing building (except redevelopment to 'New Territories Exempted House') shall result in a total development and / or redevelopment in excess of the maximum plot ratio of 2.73, and a maximum building height of 115mPD, or the gross floor area and building height of the building which was in existence on the date of the first publication in the Gazette of the notice of the interim development permission area plan, whichever is the greater.

(b) In determining the maximum gross floor area and building height for the purposes of paragraph (a) above, any floor space that is constructed or intended for use solely as car park, loading/unloading bay, plant room and caretaker's office, or caretaker's quarters and recreational facilities for the use and benefit of all the owners or occupiers of the domestic building or domestic part of the building, provided such uses and facilities are ancillary and directly related to the development or redevelopment, may be disregarded. Any floor space that is constructed or intended for use solely as public vehicle park, public transport facilities or Government, institution or community facilities may also be disregarded.

(c) In determining the maximum non-domestic gross floor area and building height for uses under Schedule II above, no new development, or addition, relocation, alteration and / or modification to or redevelopment of an existing building (except redevelopment to 'New Territories Exempted House') shall result in a total development and / or redevelopment in excess of the maximum non-domestic gross floor area of 13,700m^2 and building height of 15mPD, or the non-domestic gross floor area and building height which was in existence on the date of the first publication in the Gazette of the notice of the interim development permission area plan, whichever is the greater.

(d) In determining the maximum gross floor area for the purposes of paragraph (c) above, any floor space that is constructed or intended for use solely as car park, loading / unloading bay, plant room (including essential and non-essential plant rooms serving the industrial use) and caretaker's office, provided such uses and facilities are ancillary and directly related to the development or redevelopment, may be disregarded.

(e) Based on the individual merits of a development or redevelopment proposal, minor relaxation of the gross floor area and/or building height restrictions stated in paragraphs (a) to (c) above may be considered by the Town Planning Board on application under section 16 of the Town Planning Ordinance.

Proposed Explanatory Statement for "Residential (Group E)"

LAND-USE ZONING

"Residential (Group E)" ("R(E)") (Total Area: 8.16 ha.)

This zone covers the area to the south of Wing Kei Tsuen and the west of Castle Peak Road – Tam Mi. This zone is intended primarily for phasing out of existing industrial uses through redevelopment for residential use on application to the Town Planning Board. Whilst existing industrial uses and relocation of existing industrial development falling within the same "R(E)" zone will be tolerated, new industrial developments are not permitted in order to avoid perpetuation of industrial/residential interface problem. The Applicant(s) will be required to submit adequate information to demonstrate that the new residential development will be environmentally acceptable, and suitable mitigation measures, if required, will be implemented to address the potential industrial/residential interface problem.

Developments or redevelopment within site zoned "R(E)" under Schedule I for open air development or for building other than industrial building are subject to a maximum plot ratio of 2.73 and a maximum building height of 115mPD. The existing / relocated industrial developments under Schedule II are subject to a maximum non-domestic gross floor area of 13,700m^2 and building height of 15mPD. In order to facilitate operation, the relocated soy sauce factory will have a high ceiling requirements due to its special industrial nature, which about 7,300m^2 of the floor area will have a high headroom of about 8m and about 6,400m^2 of the floor area will have a headroom of about 5m. The industrial use will include manufacturing and food processing factory/workshop of soy, sauce, preserve fruits or vegetables or Chinese sweetmeats. No domestic buildings shall be erected thereon except ancillary premises that the District Commissioner, New Territories (Lands Department) may consider reasonable for accommodating staff and workers employed on the premises.

A primary school shall be provided upon phasing out of the existing industrial uses through redevelopment for residential use. Any floor space that is constructed or intended for use solely as public vehicle park, public transport facilities or Government, institution or community facilities shall be disregarded from GFA calculations.

To provide flexibility for innovative design, minor relaxation of the gross floor area, building height and site coverage restrictions may be considered by the Board through the planning permission system. Each application will be considered on its individual planning merits.

Rural Workshop	Vehicle Repair Workshop
Utility Installation for Private Project	Wholesale Trade
Warehouse (excluding Dangerous Goods Godown)	

Planning Intention

This zone is intended primarily for phasing out of existing industrial uses through redevelopment for residential use on application to the Town Planning Board. Whilst existing industrial uses will be tolerated, new industrial developments are not permitted in order to avoid perpetuation of industrial/residential interface problem.

(Please see next page)

RESIDENTIAL (GROUP E) (Cont'd)
(for rural areas only)

Remarks

(a) In determining the maximum gross floor area (GFA) and building height for uses under Schedule I above, no new development, or addition, alteration and / or modification to or redevelopment of an existing building (except redevelopment to 'New Territories Exempted House') shall result in a total development and / or redevelopment in excess of a maximum GFA of 126,242m^2 and a maximum building height of 115mPD, or the plot ratio and building height of the building which was in existence on the date of the first publication in the Gazette of the notice of the interim development permission area plan, whichever is the greater.

(b) In determining the maximum plot ratio and building height for the purposes of paragraph (a) above, any floor space that is constructed or intended for use solely as car park, loading/unloading bay, plant room and caretaker's office, or caretaker's quarters and recreational facilities for the use and benefit of all the owners or occupiers of the domestic building or domestic part of the building, provided such uses and facilities are ancillary and directly related to the development or redevelopment, may be disregarded. Any floor space that is constructed or intended for use solely as public vehicle park, public transport facilities or Government, institution or community facilities may also be disregarded.

(c) Based on the individual merits of a development or redevelopment proposal, minor relaxation of the GFA and / or building height restrictions stated in paragraphs (a) to (b) above may be considered by the Town Planning Board on application under section 16 of the Town Planning Ordinance.

Proposed Schedule of Uses for "OU (Industrial Use)"

OTHER SPECIFIED USES

Column 1 Uses always permitted	Column 2 Uses that may be permitted with or without conditions on application to the Town Planning Board
For "Industrial Use" only	
Government Refuse Collection Point Government Use (not elsewhere specified) Public Convenience Public Utility Installation	Eating Place Government Refuse Collection Point Government Use Industrial use Public Convenience Public Vehicle Park (excluding container vehicle) Public Utility Installation Rural Workshop Shop and Services Utility Installation for Private Project Warehouse (other than Dangerous Goods Godown) Wholesale Trade

Planning Intention

This zone is intended primarily for industrial uses that cannot be accommodated in conventional flatted factories due to extensive land and/or high ceiling requirements. It is also intended for the relocation and redevelopment of existing informal industrial uses, which are operated in workshop premises in rural area, to properly designed permanent industrial buildings.

(Please see next page)

Remarks

(a) No new development, or addition, alteration and / or modification to or redevelopment of an existing building shall result in a total development and / or redevelopment in excess of the maximum non-domestic GFA of 13,700m^2 and a maximum building height of 15mPD, or the non-domestic GFA and building height of the building which was in existence on the date of the first publication in the Gazette of the notice of the interim development permission area plan, whichever is the greater.

(b) In determining the maximum GFA for the purposes of paragraphs (a) above, any floor space that is constructed or intended for use solely as car park, loading / unloading bay, plant room (including essential and non-essential plant rooms serving the industrial use) and caretaker's office, provided such uses and facilities are ancillary and directly related to the development or redevelopment, may be disregarded.

(c) Based on the individual merits of a development or redevelopment proposal, minor relaxation of the plot ratio, GFA and / or building height restrictions stated in paragraphs (a) and (b) above may be considered by the Town Planning Board on application under section 16 of the Town Planning Ordinance.

Proposed Explanatory Statement

LAND-USE ZONING

"Residential (Group E)" ("R(E)") (Total Area: 5.2 ha.)

This zone covers the area to the south of Wing Kei Tsuen and the west of Castle Peak Road – Tam Mi. This zone is intended primarily for phasing out of existing industrial uses through redevelopment for residential use on application to the Town Planning Board. Whilst existing industrial uses falling within the same "R(E)" zone will be tolerated, new industrial developments are not permitted in order to avoid perpetuation of industrial/residential interface problem. The Applicant(s) will be required to submit adequate information to demonstrate that the new residential development will be environmentally acceptable, and suitable mitigation measures, if required, will be implemented to address the potential industrial/residential interface problem.

Developments or redevelopment within site zoned "R(E)" under Schedule I for open air development or for building other than industrial building are subject to a maximum GFA of 126,242m^2 and a maximum building height of 115mPD. In determining the maximum GFA and building height for uses under Schedule II for existing industrial development, no addition, alteration and / or modification to an existing building shall result in a total development in excess of the maximum GFA of the existing building.

A primary school shall be provided upon phasing out of the existing industrial uses through redevelopment for residential use. Any floor space that is constructed or intended for use solely as public vehicle park, public transport facilities or Government, institution or community facilities shall be disregarded from GFA calculations.

To provide flexibility for innovative design, minor relaxation of the plot ratio and / or building height restrictions may be considered by the Board through the planning permission system. Each application will be considered on its individual planning merits.

Other Specified Uses ("OU")

"OU (Industrial Use)" (Total Area: 3.1 ha.)

The planning intention of this zone is primarily to provide land for industrial uses that cannot be accommodated in conventional flatted factories due to extensive land and/or high ceiling requirements. It is also intended for the relocation and redevelopment of existing informal industrial uses and an existing soy sauce factory at Castle Peak Road – Tam Mi Section to south-west of Mo Fan Heung, which are operated in workshop premises in rural area, to properly design permanent industrial buildings.

The maximum non-domestic GFA of 13,700m^2 and maximum building height of 15mPD are for redevelopment of an existing soy sauce factory at Castle Peak Road – Tam Mi Section to south-west of Mo Fan Heung. In order to facilitate operation, the relocated soy sauce factory will have a high ceiling requirements due to its special industrial nature, which about 7,300m^2 of the floor area will

have a high headroom of about 8m and about 6,400m^2 of the floor area will have a headroom of about 5m. The factory will include manufacturing and food processing factory / workshop of soy, sauce, preserve fruits or vegetables or Chinese sweetmeats. No domestic buildings shall be erected thereon except ancillary premises that the District Commissioner, New Territories (Lands Department) may consider reasonable for accommodating staff and workers employed on the premises.

Planning Study on Proposed Land-use Zoning Boundaries (Alternative Option)

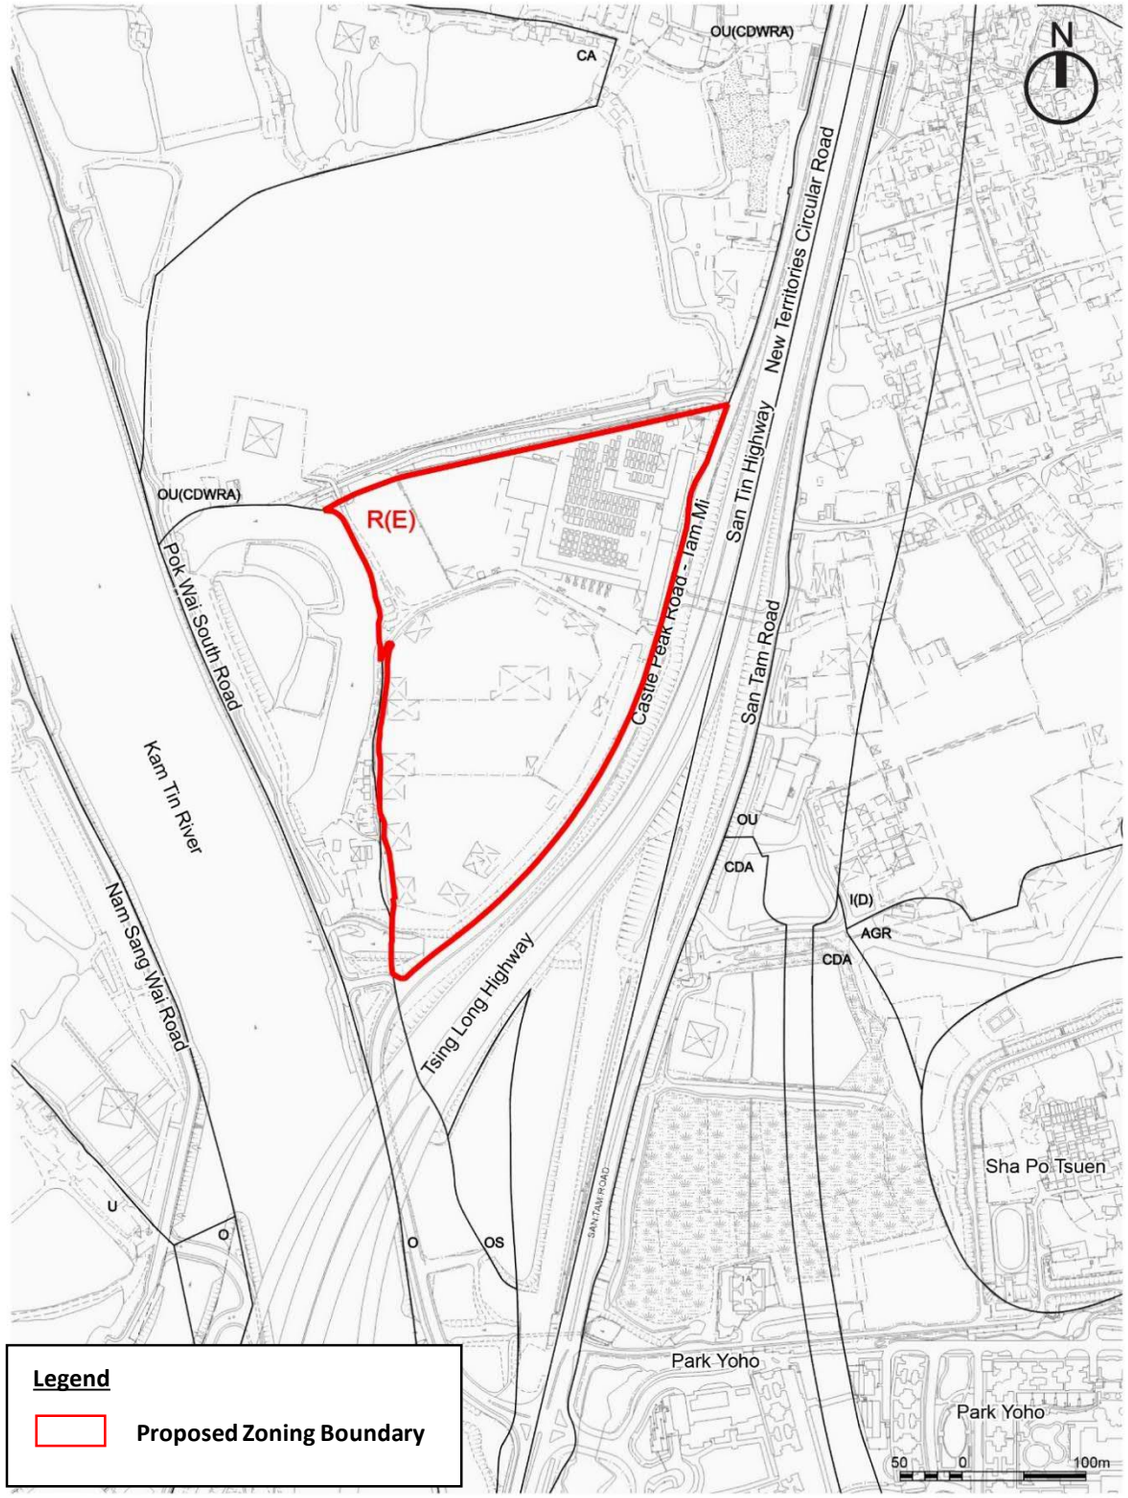
Y/YL-NSW/9

Section 12A Planning Application for Proposed Amendments to the Nam Sang Wai Outline Zoning Plan from “I(D)”, “OS” and ‘Road’ Zones to “R(E)” Zone at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D.107 and Adjoining Government Land, West of Castle Peak Road - Tam Mi, Yuen Long

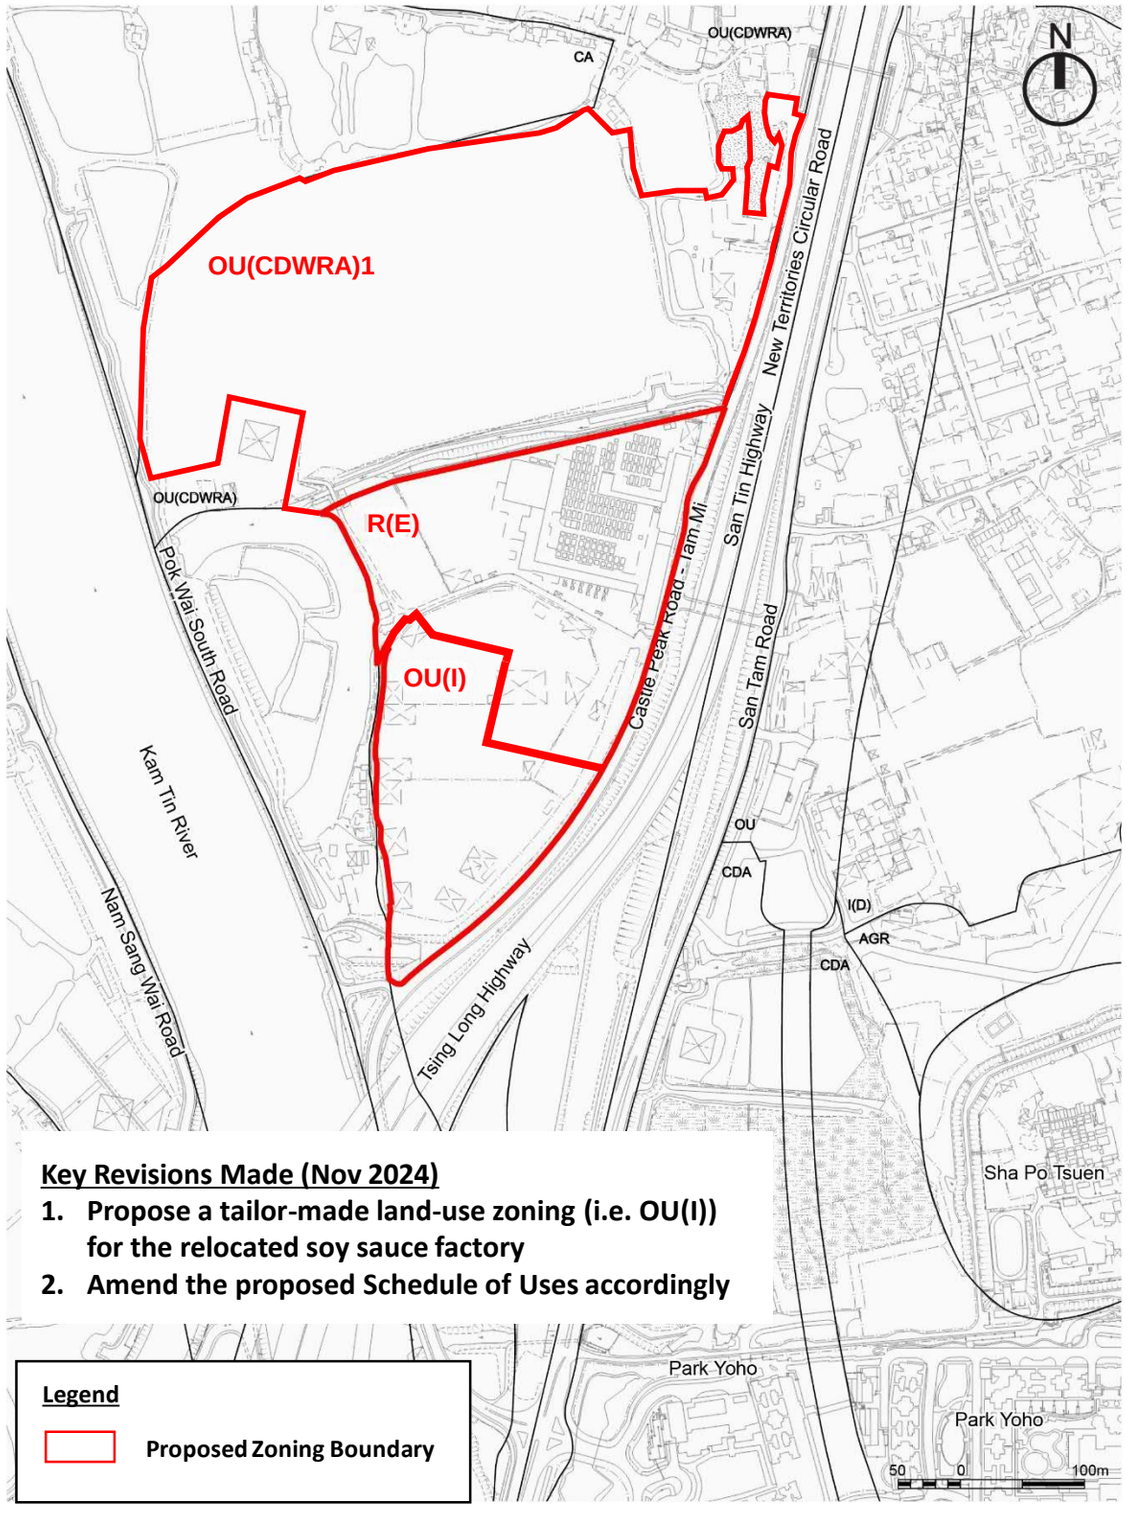
STUDY OF ZONING BOUNDARIES & OZP AMENDMENTS

(NOV 2024)

Possible Alternative Scenario (Nov 2024)



Submitted Proposed OZP Amendment



Key Revisions Made (Nov 2024)

1. **Propose a tailor-made land-use zoning (i.e. OU(I)) for the relocated soy sauce factory**
2. **Amend the proposed Schedule of Uses accordingly**

Alternative Scenario (Nov 2024)

llewelyn davies	Title: Proposed Amendments to the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8	Checked: DH	Drawn: PW
		Rev: 0	Date:
		Scale:	Figure: A1

Proposed OZP Amendments

- **Residential (Group E)**

RESIDENTIAL (GROUP E)
(for rural areas only)

Column 1 Uses always permitted	Column 2 Uses that may be permitted with or without conditions on application to the Town Planning Board
Schedule I: for open air development or for building other than industrial building	
Ambulance Depot Government Use (Police Reporting Centre, Post Office only) Rural Committee/Village Office Utility Installation for Private Project	Eating Place Educational Institution Flat Government Refuse Collection Point Government Use (not elsewhere specified) ***Hotel*** House (other than rebuilding of New Territories Exempted House or replacement of existing domestic building by New Territories Exempted House permitted under the covering Notes) Institutional Use (not elsewhere specified) Library Office Petrol Filling Station Place of Entertainment Place of Recreation, Sports or Culture Private Club Public Clinic Public Convenience Public Transport Terminus or Station Public Utility Installation Public Vehicle Park (excluding container vehicle) Recyclable Collection Centre Religious Institution Residential Institution School Shop and Services Social Welfare Facility Training Centre

To reflect the previous rezoning approval (No. Y/YL-NSW/3) for the hotel cum shopping mall development at the existing OS zone.

RESIDENTIAL (GROUP E) (Cont'd)
(for rural areas only)

Column 1 Uses always permitted	Column 2 Uses that may be permitted with or without conditions on application to the Town Planning Board
Schedule II: for existing industrial development	
Eating Place (Canteen only) Government Refuse Collection Point Government Use (not elsewhere specified) Public Utility Installation Recyclable Collection Centre Rural Workshop Utility Installation for Private Project Warehouse (excluding Dangerous Goods Godown)	~~***Industrial Use***~~ Office Petrol Filling Station Public Convenience Public Vehicle Park (excluding container vehicle) Shop and Services (ground floor only) Vehicle Repair Workshop Wholesale Trade

Planning Intention

This zone is intended primarily for phasing out of existing industrial uses through redevelopment for residential use on application to the Town Planning Board. Whilst existing industrial uses will be tolerated, new industrial developments are not permitted in order to avoid perpetuation of industrial/residential interface problem.

With reference to previous GBP submission for the relocated soy sauce factory, "soy sauce factory" is defined as "Industrial" use.

Only "minor" alteration and modification of existing soy sauce factory will be allowed in future before relocation as per the Cover Notes of the OZP.

Proposed OZP Amendments

- **Residential (Group E)**

Remarks

a) *In determining the maximum gross floor area (GFA) and building height for uses under Schedule I above, no new development, or addition, alteration and / or modification to or redevelopment of an existing building (except redevelopment to 'New Territories Exempted House') shall result in a total development and / or redevelopment in excess of a* ***maximum GFA of 126,242m² and a maximum building height of 115mPD****, or the plot ratio and building height of the building which was in existence on the date of the first publication in the Gazette of the notice of the interim development permission area plan, whichever is the greater.*

Represents the total GFA of the Proposed Development at the Residential Portion of the subject R(E) zone:

1. Domestic GFA: 115,942m²
2. Commercial Uses: 3,900m²
3. Covered Transport Lay-by: 6,400m²

b) *In determining the maximum plot ratio and building height for the purposes of paragraph (a) above, any floor space that is constructed or intended for use solely as car park, loading/unloading bay, plant room and caretaker's office, or caretaker's quarters and recreational facilities for the use and benefit of all the owners or occupiers of the domestic building or domestic part of the building, provided such uses and facilities are ancillary and directly related to the development or redevelopment, may be disregarded.* ***Any floor space that is constructed or intended for use solely as public vehicle park, public transport facilities or Government, institution or community facilities may also be disregarded.***

The floor area of the reserved school site will be disregarded from GFA calculations

c) *Based on the individual merits of a development or redevelopment proposal,* ***minor relaxation of the GFA and / or building height restrictions*** *stated in paragraphs (a) to (b) above may be considered by the Town Planning Board on application under section 16 of the Town Planning Ordinance.*

Should there be any developments / redevelopments of the piece of Government land that is currently occupied by existing temporary settlements at the western portion of the subject R(E) zone, the concerned party is required to submit S16 planning application with minor relaxation of development restrictions for TPB's approval.

Proposed OZP Amendments

- **Residential (Group E)**

"Residential (Group E)" ("R(E)")

This zone covers the area to the south of Wing Kei Tsuen and the west of Castle Peak Road – Tam Mi. This zone is intended primarily for phasing out of existing industrial uses through redevelopment for residential use on application to the Town Planning Board. Whilst existing industrial uses falling within the same "R(E)" zone will be tolerated, new industrial developments are not permitted in order to avoid perpetuation of industrial/residential interface problem. The Applicant(s) will be required to submit adequate information to demonstrate that the new residential development will be environmentally acceptable, and suitable mitigation measures, if required, will be implemented to address the potential industrial/residential interface problem.

Developments or redevelopment within site zoned "R(E)" under Schedule I for open air development or for building other than industrial building are subject to a maximum GFA of 126,242m^2 and a maximum building height of 115mPD. In determining the maximum GFA and building height for uses under Schedule II for existing industrial development, no addition, alteration and / or modification to an existing building shall result in a total development in excess of the maximum GFA of the existing building.

A primary school shall be provided upon phasing out of the existing industrial uses through redevelopment for residential use. Any floor space that is constructed or intended for use solely as public vehicle park, public transport facilities or Government, institution or community facilities shall be disregarded from GFA calculations.

To provide flexibility for innovative design, minor relaxation of the plot ratio and / or building height restrictions may be considered by the Board through the planning permission system. Each application will be considered on its individual planning merits.

Proposed OZP Amendments

- **OU (Industrial Use)**

OTHER SPECIFIED USES

Column 1 *Uses always permitted*	*Column 2* *Uses that may be permitted with or without conditions on application to the Town Planning Board*
For "Industrial Use" only	
Government Refuse Collection Point *Government Use (not elsewhere specified)* *Public Convenience* *Public Utility Installation*	*Eating Place* *Government Refuse Collection Point* *Government Use* *Industrial use* *Public Convenience* *Public Vehicle Park (excluding container vehicle)* *Public Utility Installation* *Rural Workshop* *Shop and Services* *Utility Installation for Private Project* *Warehouse (other than Dangerous Goods Godown)* *Wholesale Trade*

Planning Intention

This zone is intended primarily for industrial uses that cannot be accommodated in conventional flatted factories due to extensive land and/or high ceiling requirements. It is also intended for the relocation and redevelopment of existing informal industrial uses, which are operated in workshop premises in rural area, to properly designed permanent industrial buildings.

Some "special" plant rooms serving the soy sauce factory may be considered as GFA accountable non-essential plant rooms by BD. They include steam boiler rooms, fan rooms, air compressor room, photo voltaic (PV) panel room, LPG store, DG chemical store, waste water treatment plant and associated plant rooms.

Remarks

a) *No new development, or addition, alteration and / or modification to or redevelopment of an existing building shall result in a total development and / or redevelopment in excess of the maximum non-domestic GFA of 13,700m^2 and a maximum building height of 15mPD, or the non-domestic GFA and building height of the building which was in existence on the date of the first publication in the Gazette of the notice of the interim development permission area plan, whichever is the greater.*

b) *In determining the maximum GFA for the purposes of paragraphs (a) above, any floor space that is constructed or intended for use solely as car park, loading / unloading bay,* ***plant room (including essential and non-essential plant rooms serving the industrial use)*** *and caretaker's office, provided such uses and facilities are ancillary and directly related to the development or redevelopment, may be disregarded.*

c) *Based on the individual merits of a development or redevelopment proposal, minor relaxation of the plot ratio, GFA and / or building height restrictions stated in paragraphs (a) and (b) above may be considered by the Town Planning Board on application under section 16 of the Town Planning Ordinance.*

Proposed OZP Amendments

- **OU (Industrial Use)**

"OU (Industrial Use)" ("OU(I)")

The planning intention of this zone is primarily to provide land for industrial uses that cannot be accommodated in conventional flatted factories due to extensive land and/or high ceiling requirements. It is also intended for the relocation and redevelopment of existing informal industrial uses and an existing soy sauce factory at Castle Peak Road – Tam Mi Section to south-west of Mo Fan Heung, which are operated in workshop premises in rural area, to properly design permanent industrial buildings.

The maximum non-domestic GFA of 13,700m^2 and maximum building height of 15mPD are for redevelopment of an existing soy sauce factory at Castle Peak Road – Tam Mi Section to south-west of Mo Fan Heung. In order to facilitate operation, the relocated soy sauce factory will have a high ceiling requirements due to its special industrial nature, which about 7,300m^2 of the floor area will have a high headroom of about 8m and about 6,400m^2 of the floor area will have a headroom of about 5m. The factory will include manufacturing and food processing factory / workshop of soy, sauce, preserve fruits or vegetables or Chinese sweetmeats. No domestic buildings shall be erected thereon except ancillary premises that the District Commissioner, New Territories (Lands Department) may consider reasonable for accommodating staff and workers employed on the premises.

A.1 INTRODUCTION

A.1.1 A Section 12A Planning Application is submitted for Proposed Amendments to the Approved Nam Sang Wai Outline Zoning Plan from "I(D)", "OS" and 'Road' Zones to "R(E)" Zone in support of Comprehensive Development, Reserved School Site and Relocated Soy Sauce Factory at Lot 1910 RP and Lot 1743 S.C RP (part) in D.D. 107 and Adjoining Government Land, Yuen Long (hereafter referred as the "Application Site"). This report outlines the landscape design proposal for the Proposed Development at the Application Site.

A.1.2 This landscape design proposal is submitted to demonstrate the effect of the building design of the Proposed Development at the Application Site on landscape and visual aspects. It includes an assessment of existing trees and a landscape layout and proposed planting to establish a coherent character for the future development. The landscape proposal provides a concept to improve the quality of the existing environment and enhance the integration of the Proposed Development with the site context.

A.2 EXISTING SITE CONDITIONS

A.2.1 **Context / General Neighbourhood** – The Application Site is surrounded by Castle Peak Road (Tam Mi) and San Tin Highway to the east and south, a proposed OU(CDWRA)1 site adjacent to the north (under separate submission) and a meander of Kam Tin River to the west. The surrounding land use of the Application Site is predominantly a mixture of ponds, industrial developments and vacant land. There is an electric pylon near the north-western corner of the Application Site.

A.2.2 **The Site** –The site is generally flat and the ground surface is generally paved except for the north-western corner near the electric pylon which is covered by grass and shrubs and a group of existing trees along the boundary. The land is mainly used as a factory and open container storage. As of October 2021, the site consists of the said factory's warehouses and associated storage silos and structures.

A.3 PROPOSED DEVELOPMENT FORM

A.3.1 **Building Layout** – According to the indicative scheme, the northern portion of the Application Site is proposed for a medium-density comprehensive development with residential and supporting commercial and ancillary uses (hereafter referred as the 'Residential Portion'). The southern portion of the Application Site will be for the future operation of the relocated existing soy sauce factory (hereafter referred as 'Soy Sauce Factory Portion'). Furthermore, to cater for the demand on educational facility of the future population in the area, a school site for primary school has been reserved within the Application Site (hereafter referred as 'School Portion').

The Residential Portion, located at the northern part of the Application Site, stretches across an area of approximately 46,501 m^2. The Proposed Development consists of a mixture of private residential and commercial, comprising a covered transport lay-by (hereafter referred as CTL), commercial, shop and services areas along with 11 residential blocks. The height of the 11 residential blocks will vary from 15 to 29 domestic storeys. The residential blocks will be constructed over the commercial, shop and services areas, the covered transport lay-by (CTL) and a basement car park.

A.3.2 **Road and Civil Works** – Due to the development mix (the covered transport lay-by (CTL) , the residential blocks and commercial, shops and services areas) on-site, there will be two site entrances in order to separate different types of

users. Both entrances are located along Castle Peak Road. One access at the eastern side of the site next to the School Portion mainly serves the reserved school site and existing temporary structures (unallocated government Land). Another one will mainly facilitate access for the covered transport lay-by (CTL), residents and visitors of the residential portion. Footpaths are provided along the roadsides for safe pedestrian access.

A.4 TREE SURVEY AND PROPOSAL

A. 4.1 Tree Survey Findings – The tree survey for the Application Site was carried out in August 2021 and in December 2021. Due to the mix of the proposed development and reserved areas of the Application Site, the tree survey was organised with reference to the boundaries of the different development portions. A total of 125 nos. of trees were surveyed at the Residential Portion, 21 nos. of trees at the School Portion and 169 nos. of trees surveyed at the Soy Sauce Factory Portion. A summary of the tree groups is listed in **Table 1** below and the approximate location of the tree groups is provided in **Appendix A – Tree Assessment.**

Table 1 - Summary of Existing Tree Groups

Location	Tree Group	Approximate Number of Trees	Total Number of Trees Surveyed per Location
School Portion	TG1	21	21
Residential Portion	TG2	60	125
	TG3	14	
	TG4	10	
	TG5	41	
Soy Sauce Factory Portion	TG6	95	169
	TG7	74	
GRAND TOTAL		**315 nos.**	

Overall, there are 7 tree groups containing a grand total of approximately 315 nos. of existing trees found within the Application Site boundary. The most frequently occurring species are *Acacia auriculiformis, Leucaena leucocephala* and *Melaleuca cajuputi* subsp. *Cumingiana*. Fruit trees such as *Carica papaya* and *Dimocarpus longan* are also found. The condition of the trees is generally fair to poor, and most are of low amenity value and the survival rate of the trees after transplanting is expected to be generally low. For Tree Survey details, refer to **Appendix A – Tree Assessment**.

None of the surveyed trees are protected species listed under the Forestry Regulations, Forests and Countryside Ordinance (Cap.96 sub. Leg.) or are "Old and Valuable Trees" as defined in DEVB TC (W) No. 5/2020 "Registration and Preservation of Old and Valuable Trees", "Champion Trees" as identified in the book "Champion Trees in Urban Hong Kong" or trees of particular interest as defined in the GLTMS Guidelines on Tree Risk Assessment and Management Arrangement (2019 9th Ed.).

A. 4.2 Proposed Treatment of Existing Trees

A.4.2.1 Retained Tree Groups – No existing tree groups are proposed to be retained.

A.4.2.2 Affected Tree Groups –All 7 nos. of tree groups with a total of 315 nos. of trees will be affected by the Proposed Development. Trees along the site reserved for the School Portion and Soy Sauce Factory Portion will also be affected in future site works and are therefore are proposed to be felled.

Trees in these groups are all found to be in poor form and poor to fair health condition with low amenity value and low survival rate. The most frequently occurring species are *Leucaena leucocephala*, an undesirable invasive exotic species (refer to Development Bureau Technical Circular (Works) No. 4/2020 Clause 8). This self-seeded hostile species will obstruct the natural succession of the indigenous species during the establishment of the newly planted species and should therefore be removed.

A. 4.3 New Planting Proposal

A.4.3.1 A minimum of 315 nos. of standard trees of enhanced quality will be planted at the Residential Portion to compensate for all trees felled within the Application Site, including those felled in the School Portion and Soy Sauce Factory Portion, achieving the compensatory planting ratio of 1:1. A breakdown of proposed tree treatment and tree compensation is shown in **Table 2** below. New trees will form part of the amenity tree planting under the landscape proposal. Indicative tree planting species are provided in **Table 4** under *section A.5.7* below and their indicative locations are indicated on the Landscape Master Plan in **Figure S1-LMP-01**.

Table 2 – Breakdown of Proposed Tree Treatment and Tree Compensation

Location	Existing Trees					Compensatory Trees
	Tree Group	Approximate Number of Trees	Proposed Treatment			Number of Compensatory Trees

A.5 LANDSCAPE DESIGN PROPOSAL

A.5.1 Landscape Design Principles

A.5.1.1 The Landscape Design adopts the following principles:

(i) Create a landscape design corresponding to the specific site conditions of the Proposed Development;

(ii) Ensure the Proposed Development is sensitively integrated into the neighbouring areas via naturalistic edge treatments;

(iii) Ensure the character of the landscape design compliments the aesthetic of the architectural elements and is consistent with the overall design language;

(iv) Minimise the visual impact of the Proposed Development through carefully planned landscape treatment;

(v) Create suitable outdoor spaces for active and passive leisure activities; and

(vi) Promote the use of native plant species throughout the landscape to contribute to the sustainability of the site and the adjacent neighbourhood, and to introduce exotic ornamental species where necessary to enrich the sense of place of featured areas.

A.5.2 Conceptual Landscape Design

A.5.2.1 The Application Site lies between Castle Peak Road (Tam Mi) to the east and the meander of Kam Tin River to the west. The northern and southern sides of the Application Site are bounded by the adjacent proposed OU(CDWRA)1 site and Pok Wai South Road respectively. Due to the site's geographical location near the riverbank of Kam Tin River, in addition to the development mix of CTL, commercial and the residential development, the general concept of the Proposed Development is to create a nature-oriented suburban communal environment.

The covered transport lay-by (CTL) is proposed to be located along Castle Peak Road at the northern of the Residential Portion Site which is accessed from the main entrance of the Application site.

The Residential Development consists of a Club House and some sitting out areas are proposed to provide communal recreational facilities for future residents. Towers on the eastern side are in two groups of four, whereas the towers on the western side comprise a cluster of 1-tower and 2-tower blocks . All tower groups are separated with adequate spacing to allow breezeway and air paths throughout the Application Site to improve the microclimate at lower levels. An internal access road serves as an efficient connector and EVA for all residential blocks. Basement parking is provided and can be accessed through the ramp on the southern side of the roundabout nearby the second entrance close to the reserved school site. Naturalistic planting is proposed along the site boundaries to blend into the surrounding environment of the neighbourhood, and provide informal landscape areas for residents.

A.5.3 Major Landscape Elements (Refer to Figure A2)

A.5.3.1 **Landscape at Main Access** – As mentioned in the *section A.3.2*, accesses to the Residential Portion will all be located along the existing Castle Peak Road. The entry to the residences will be defined by attractive trees and shrub planting with a feature tree and paving to create a welcoming entrance and signature identity for the Residential Portion.

A.1.1.1 **Streetscape** – Extensive soft landscaping is proposed to create a green interior streetscape. The planting will aim to provide colour and texture to the streetscape throughout the year and generally soften the

appearance of the architectural elements. On the north-western and southern side of the Application Site, trees will be planted as a noise and visual buffer to the natural environment of the adjacent meander of Kam Tin River.

A.1.1.2 Streetscape – Extensive soft landscaping is proposed to create a green interior streetscape. The planting will aim to provide colour and texture to the streetscape throughout the year and generally soften the appearance of the architectural elements. On the north-western and southern side of the Application Site, trees will be planted as a noise and visual buffer to the natural environment of the adjacent meander of Kam Tin River.

A.1.1.3 Residential Area – Hard and soft landscape spaces are proposed around the residential towers to compliment the built environment. Planting schemes with themed planting palettes will differentiate different character zones. A selection of natural and contemporary materials will be chosen to produce attractive design solutions.

A.1.1.4 Recreational Facilities and Outdoor Spaces – A selection of recreational facilities, landscape garden and communal gardens will be integrated into the landscape areas and the upper level of the commercial areas and the covered transport lay-by (CTL) for all residents and visitors. Outdoor seating will be provided at the gardens, where extensive ornamental shrub planting beds will be created to provide seasonal interest and layers of texture throughout the year. Intergenerational play areas and undulating landscape mounds for play and picnics will also be provided within these spaces.

A.1.2 Landscape Hardworks Schedule – General landscape hardworks elements and materials are as follows:

Table 3 - General Landscape Hardworks Elements and Materials

AREA/ LOCATION	LANDSCAPE HARDWORKS
Main Entrance	*Vehicular road surface* – natural granite setts/ tiles or similar; *Pedestrian footpath* – natural granite/ tiles or similar; *Kerb/ Planter* – natural granite/ tiles or similar.
Streetscape	*Vehicular road surface* – precast concrete/ clay pavers; *Pedestrian footpath* – precast concrete/ clay pavers; *Kerb/ Planter* – precast concrete/ stone paving/ tiles or similar; *Street furniture* – proprietary products.
Residential & Clubhouse Landscape	*Footpath* – natural granite/ stone paving/ tiles or similar; *Kerb/ Planter* – natural granite/ stone paving/ tiles or similar; *Swimming pool* – timber deck and tile finish to pool or similar; *Children's Playground* – proprietary play equipment and safety matting; *Shade Structures* – Concrete structure with granite or timber cladding, metal frames, and glass canopy; *Seating Features* – Concrete structure with timber cladding or similar.
Kindergarten & Commercial Peripheral Landscape	*Pedestrian footpath* – natural granite/ tiles/clay pavers or similar; *Kerb/ Planter* – natural granite/ stone paving/ tiles or similar; *Vehicular road surface* – precast concrete/ clay pavers.

A.1.3 **Children's Playground Safety** – The outdoor children's playground will be designed in full compliance with the relevant safety standards and guidelines with sufficient safety zones and impact absorbing matting and will be installed in accordance with the manufacturer's specification or guidelines.

A.1.4 **Peripheral Planting** – A peripheral planting strip along the residential site boundary, except for the entrances, will provide the adjacent land uses a green interface and screening of the Residential Portion at lower levels. The eastern site boundary planting will also screen and mitigate the visual impact of the adjacent Castle Peak Road.

A.1.5 **Planting Palette** – Tree species will be planted at an optimum spacing for establishment and long-term growth. Shrub species will be primarily native species but some ornamental species will be selected to deliver particular effects. An indicative choice of plant materials is indicated in **Table 4**.

Table 4 - Proposed Planting Palette

SPECIES *	CHINESE NAME	SIZE	SPACING (mm)
TREES			
Bauhinia spp.	羊蹄甲属	Heavy Standard	4000
Senna surattensis	黃槐决明	Heavy Standard	4000
Cinnamomum burmannii *	陰香	Heavy Standard	4000
Elaeocarpus chinensis *	中華杜英	Heavy Standard	4000
Ficus benjamina	垂葉榕	Heavy Standard	4000
Grevillea robusta	銀樺	Heavy Standard	4000
Lagerstroemia indica	紫薇	Heavy Standard	4000
Michelia x *alba*	白蘭	Heavy Standard	4000
Podocarpus macrophyllus *	羅漢松	Heavy Standard	4000
Pongamia pinnata *	水黃皮	Heavy Standard	4000
Spathodea campanulata	火焰樹	Heavy Standard	4000
Sterculia lanceolata *	假蘋婆	Heavy Standard	4000
Terminalia mantaly	小葉欖仁	Heavy Standard	4000
SHRUBS			
Aglaia odorata	米仔蘭	Varies	Varies
Bridelia tomentosa *	土蜜樹	Varies	Varies
Codiaeum variegatum	變葉木	Varies	Varies
Duranta repens "Golden Leaves'	金葉假連翹	Varies	Varies
Gardenia jasminoides *	梔子	Varies	Varies
Polyspora axillaris *	大頭茶	Varies	Varies
Ixora chinensis *	龍船花	Varies	Varies

Murraya paniculata	九里香	Varies	Varies
Rhododendron simsii *	紅杜鵑	Varies	Varies
GROUND COVER			
Arachis Duranensis	蔓花生	Varies	Varies
Asparagus desniflorus 'Myersii'	狐尾天門冬	Varies	Varies
Cuphea hyssopifolia	細葉萼距花	Varies	Varies
Dianella ensifolia *	山菅蘭	Varies	Varies
Euphorbia milii 'Dwarf'	花麒麟	Varies	Varies
Lantana montevidensis	小葉馬纓丹	Varies	Varies
Liriope spicata *	山麥冬	Varies	Varies
Nephrolepis exaltata 'Bostoniensis' *	波士頓腎蕨	Varies	Varies
Ophiopogon japonica *	沿階草	Varies	Varies
Tradescantia spathacea	紫背萬年青	Varies	Varies

SPECIES *	CHINESE NAME	SIZE	SPACING (mm)
CLIMBERS			
Bougainvillea spp.	勒杜鵑屬	Varies	Varies
Lonicera japonica	金銀花	Varies	Varies
Quisqualis indica	使君子	Varies	Varies
LAWN			
Zoysia japonica	**結縷草**	300 x 300 squares	n/a

Note: species selection will be subject to detail design development & market availability

**) native species*

A.1.6 Soil Depth – Sufficient soil depth and structural loading capacity will be provided for all planting areas over basement (minimum 1,200mm soil depth will be provided for tree planting, 600mm will be provided for shrubs and 300mm for groundcover and grass areas).

A.1.7 Noise Barriers, Slopes and Retaining Structures – There are no proposed noise barriers, slopes or retaining structures within the development. Tree and climber planting are proposed at the base of the boundary fences for screening to minimise the visual impact of said structures.

A.1.8 Landscape Maintenance – A minimum 12 month Establishment Period will be provided for all planting under the construction contract. Therefore, landscape maintenance will be undertaken by an approved landscape maintenance company. A landscape maintenance manual shall be prepared to specify maintenance procedures required.

A.1.9 Landscape Area Provision

A.1.9.1 Private Open Space – The Development Site Area (Residential Portion) is about 46,501 m^2 with a design population of 8,099. The total open space area requirement of not less than 8,099 m^2 (the minimum standard of 10 ha per 100,000 persons as stipulated in Chapter 4 of the Hong Kong Planning Standards and Guidelines) can be achieved.

A.1.9.2 Greenery Provision – With a total greenery area of not less than 13,950 m^2, the minimum 30% greenery is achieved in accordance with the requirement of PNAP (APP-152).

1 Introduction

1.1 This Visual Impact Assessment (VIA) is prepared for the planning application submitted to the Town Planning Board (the Board) under Section 12A of the Town Planning Ordinance for rezoning the "Industrial (Group D)" ("I(D)"), "Open Storage" ("OS") and 'Road' zones to "Residential (Group E)" ("R(E)") zone or an alternative option with incorporation of tailor-made "Other Specified Use" annotated "Industrial" land-use zoning if deem appropriate by the Town Planning Board on the Draft Nam Sang Wai Outline Zoning Plan (the OZP) No. S/YL-NSW/9, in support of a comprehensive development at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D. 107 and adjoining Government Land, West of Castle Peak Road – Tam Mi, Yuen Long (i.e. hereafter referred to as the Application Site) (see **Figure 1.1**).

1.2 Served by a comprehensive transport network, the Application Site is well connected with other parts of the New Territories and the metro areas in Hong Kong. Furthermore, according to the Government's publication of the railway scheme for the Northern Link (NOL), the planned Au Tau Station will be implemented about 150m away to the east of the Application Site. The planned station will give rise to the opportunity of releasing the development potential of the Application Site and its surrounding areas.

1.3 According to the Northern Metropolis Development Strategy (NMDS) formulated by the Government in October 2021 and the Northern Metropolis Action Agenda 2023, the Northern New Territories in which the Application Site is situated, will be drastically transformed into an urban context in the future. As a whole, the Northern Metropolis will become an international I&T hub with unique metropolitan landscape marked with "Urban-Rural Integration and Co-existence of Development and Conservation" to serve as a future economic engine and important employment hub between Hong Kong and Shenzhen.

1.4 Considering that the Northern New Territories including the Application Site has undergone and will undergo tremendous changes in the planning and development context, the Applicant intends to seize this unique opportunity to unleash the development potential of the Application Site for a medium-density residential use to complement the changing spatial development framework of the area. Moreover, to align with the policy directives on re-industrialisation (also known as Industry 4.0), the indicative development proposal for the proposed "R(E)" zone would be divided into 3 portions, namely the Residential Portion, the Relocated Soy Sauce

llewelyn davies	Title: Location Plan	Checked	DH	Drawn PW
		Rev	0	Date Feb 2024
		Scale NA		Figure 1.1

Factory Portion and the Reserved School Site. Details of the proposal would be explained in Section 2.

1.5 This VIA was prepared to analyse:

- **Interim Scenario**: The potential visual impact that may be induced by the Proposed Development under the current context with completion of the approved / planned developments, including the approved residential developments (i) Application No. A/YL-KTN/604; (ii) Application No. A/YL-KTN/663; and (iii) Application No. A/YL-NSW/274; (iv) Application No. Y/YL-NSW/7; (v) planned Sha Po Public Housing Development; and (vi) planned residential development in Tung Shing Lei under Land Sharing Pilot Scheme.

- **Ultimate Scenario:** The visual context in the long-run with full implementation of the Proposed Development, approved / planned developments and another planning application to the immediate in support of a comprehensive development to the immediate north of the Application Site in the long run.

1.6 This VIA was prepared in accordance with the 'Town Planning Board Guidelines No. 41 – Guidelines on Submission of Visual Impact Assessment for Planning Applications to the Town Planning Board' ('TPB PG-No. 41') in order to evaluate the degree of visual impacts on visual sensitive receivers (VSRs) from major public viewpoints (VPs) due to the Proposed Development at the Application Site. Latest approved / planned development context and adjacent ongoing planning application will also be taken into account in the VIA.

1.7 This VIA covers the following sections:-

Section 2:	describes the Proposed Development;
Section 3:	identifies the visual context and the baseline visual condition of the Application Site (e.g. visual elements and resources, assessment area, etc.);
Section 4:	identifies the key public viewpoints and visual sensitive receivers;
Section 5:	appraises the potential visual impacts induced by the Proposed Development; and
Section 6:	summarises the findings of the VIA.

2 Indicative Development Scheme

2.1 Major Development Parameters

2.1.1 In support of the above proposed planning intention, an indicative development proposal has been prepared. According to the indicative scheme, the northern portion of the Application Site will be proposed to be a medium-density comprehensive development with residential and supporting commercial and ancillary uses. The southern portion of the Application Site will be for the future operation of the relocated existing soy sauce factory. To cater for the potential educational needs of the area's future population, a site (of site area of 6,200m^2) has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

2.1.2 The Indicative Master Layout Plan (MLP) and Section Plans of the Proposed Development are shown in **Figures 2.1** to **2.3**. For the major development parameters of the Proposed Development, please refer to **Table 2.1**.

1. All spot levels marked on the building structures (including towers, clubhouse and GIC blocks) refer to the main roof levels.
2. No.of storeys marks on plans show total no.of storeys including towers and podiums, excluding basement(s).
3. "Commercial uses" include 'Eating Place', 'Shop and Services', 'School' (kindergarten, nursery, language, computer, commercial and tutorial schools, arts school, ballet and other types of schools providing interest/ hobby related courses), 'Place of Entertainment' and 'Place of Recreation, Sports or Culture'

Development Parameters	
Application Site Area (m^2) (about)	81,550 (1)
Residential Portion	47,891 (1)
Relocated Soy Sauce Factory Portion	27,459
Reserved School Site	6,200
Development Site Area (m^2) (about)	73,960 (2)
Residential Portion	46,501
Relocated Soy Sauce Factory Portion	27,459
Residential Portion	
Domestic GFA (m^2) (about)	115,942
Non-domestic GFA (m^2)	
Commercial Uses (m^2) (3) (about)	3,900
Covered Transport Lay-by (m^2) (about)	6,400
Maximum Building Height (to the main roof)	Not more than 115mPD
No. of Residential Towers	11
No. of Units	3,115
Average Flat Size (m^2) (about)	37.2
No. of Domestic Storeys (4)	Not more than 28
No. of Non-domestic Storeys	
Non-domestic Podium (5)	Not more than 1
Basement Carpark	1
Anticipated Population (6)	8,099
Communal Private Open Space (m^2) (7)	8,099
Maximum Site Coverage (above ground)	
Domestic	< 33.33%
Non-domestic	< 100%
Clubhouse Facilities (8)	
GFA (m^2) (about) (9)	3,500
No. of Storeys	2
Relocated Soy Sauce Factory Portion (10)	
Non-domestic GFA (m^2)	Not more than 13,700 (11) (12)
Maximum Building Height (to the main roof)	Not more than 15 mPD (11)

Remarks:

(1) Include portion of Government land currently occupied by some temporary structures at the western portion of the Application Site with an area of about 1,390m^2.
(2) Including the proposed public road within the Application Site and the proposed traffic improvement works along Castle Peak Road.
(3) Include commercial GFA for 'Shop and Services', 'Eating Place, 'School' (nursery / kindergarten / language, computer, commercial or tutorial schools / technical institutes / other types of schools providing interests and hobby related courses for subjects such as arts, ballet and etc.), 'Place of Entertainment' and 'Place of Recreation, Sports or Culture' uses at the commercial portion.
(4) Exclude transfer plates.
(5) Including commercial uses and Covered Transport Lay-by.
(6) Assuming a Person-Per-Flat ratio of 2.6 as per the suggestion in HK2030+.
(7) Not less than 1m^2 per person according to HKPSG.
(8) Exempted from plot ratio calculation.
(9) Or such other areas of clubhouse as may be approved by the Buildings Department based on the total permissible domestic GFA for individual land parcel (site under the Buildings Ordinance) at the future GBP.
(10) For the manufacture of soy, sauce, preserved fruits or vegetables or Chinese sweetmeats and no domestic buildings shall be erected thereon except ancillary premises that the District Commissioner, New Territories (Lands Department) may consider reasonable for accommodating staff and workers employed on the premises.
(11) In order to facilitate the future operation of the relocated soy sauce factory, about 7,300m^2 of the floor area of the future plant room will have a high headroom of about 8m and about 6,400m^2 of the floor area of the future plant room will have a headroom of about 5m.
(12) The floor space that is constructed for plant rooms (including steam boiler rooms, fan rooms, air compressor room, photo voltaic (PV) panel room, LPG store, DG chemical store, waste water treatment plant and associated plant rooms) for the relocated soy sauce factory is exempted from GFA calculation.

Residential Portion

2.1.3 The Proposed Residential Portion is located at the northern portion of the Application Site. It has a development site area of about 46,501m^2, a domestic GFA of about 115,942m^2 and comprises 11 nos. of residential towers. The maximum building height (to the main roof) is not more than 115mPD, with stepped building heights profile descending from east to west.

2.1.4 The Proposed Development provides about a total 3,115 nos. of flats. Based on a Person-Per-Flat ratio of 2.6 as per the suggestion in HK2030+, the Proposed Development accommodates a population of about 8,099 persons. Clubhouse facilities will also be provided. A non-domestic GFA of about 10,300m² is also proposed to support the needs of the future residents and the wider community, which comprises of commercial GFA of about 3,900m^2 and a covered transport lay-by of GFA of about 6,400m^2.

Reserved School Site

2.1.5 To cater for the potential educational needs of the area's future population, a site (of site area of 6,200m^2) has been reserved for school use in the middle portion of the Application Site. In the event that the reserved site is to be developed for educational purposes to be implemented by private sector, the future operator will make required application(s) and registration(s) to relevant Government authorities for approval under the prevailing policy.

Relocated Soy Sauce Factory Portion

2.1.6 The southern portion of the Application Site will be reserved for the relocation of the existing soy sauce factory. A total non-domestic GFA of not more than 13,700m^2 and a maximum building height of not more than 15mPD are allowed for the operation of the relocated soy sauce factory.

3 Baseline Visual Condition

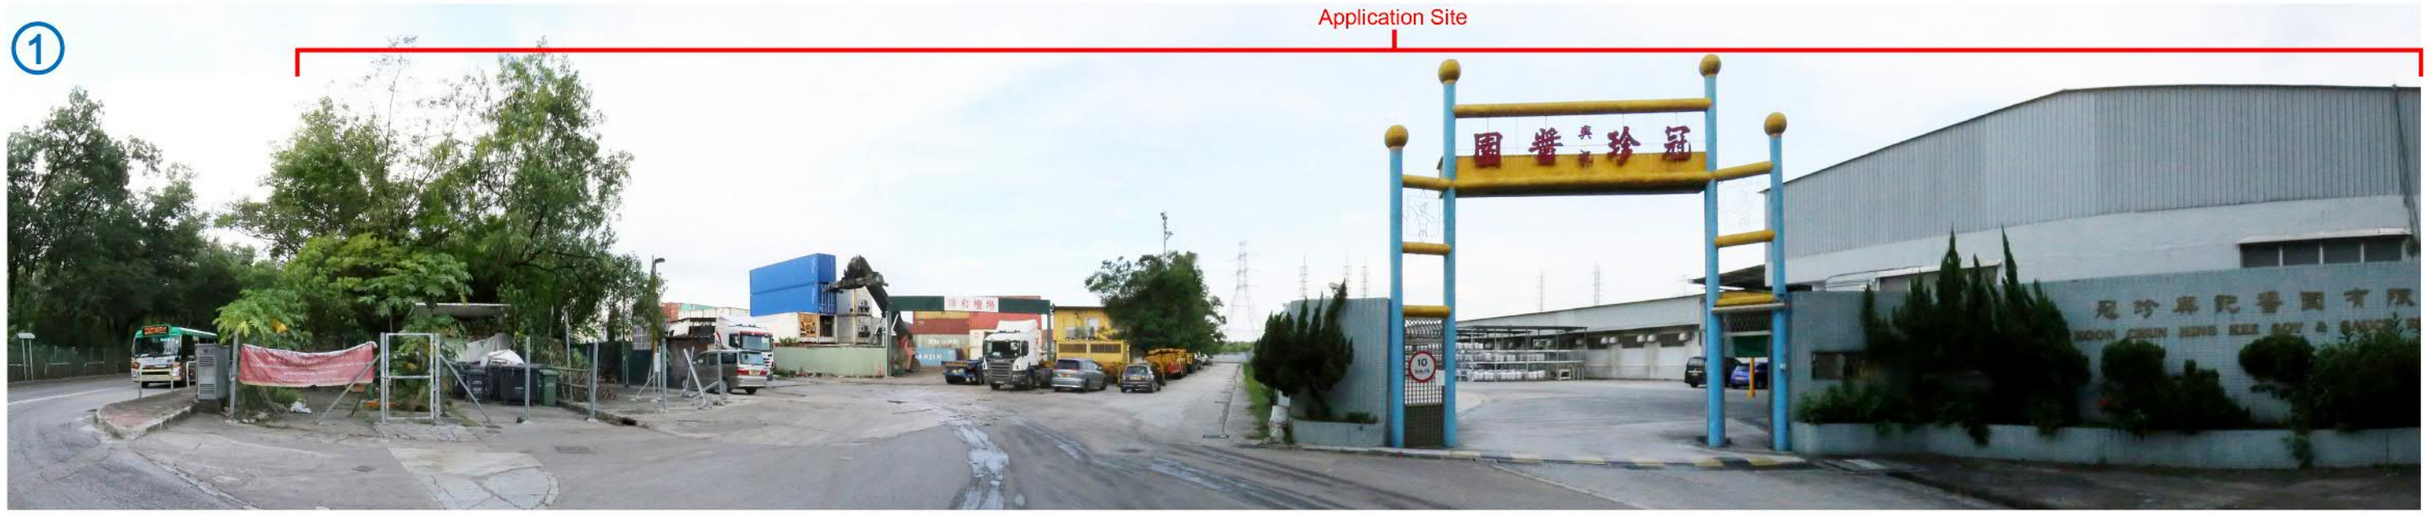
3.1 Visual Context and Character

3.1.1 At present, the Application Site mainly falling within "I(D)" is occupied by an existing soy sauce factory, with the western part of the Application Site being unused land with scattered temporary structures. The portion near the south-eastern periphery of the Application Site which falls within the "OS" zone is currently used as an container storage yard. **Figure 3.1** illustrates the existing site conditions and the surrounding context.

3.1.2 Situated adjacent to the northeast of Yuen Long New Town, in addition to the high-density and high-rise residential developments around the Yuen Long Station, a cluster of existing development (i.e. Park Yoho), as well as approved / planned developments (including the comprehensive developments in the "Comprehensive Development Area" ("CDA") and "CDA(1)" zones), are situated in close proximity to the southeast of the Application Site. In particular, a recent planning application (Application No. A/YL-NSW/274) for development of a residential and community hub to the southwest of about 750m away from the Application Site with a similar maximum plot ratio of not more than 2.29, was approved by the Board in February 2021. In addition, the Land Sharing Pilot Scheme Application No. LSPS/002 for proposed residential development in Tung Shing Lei was recently gazetted for OZP amendment on 12.7.2024, the LSPS development has a plot ratio of about 4.45 (public portion) and about 2.16 (private portion); and building height of not more than 100mPD.

3.1.3 To the north about 360m of the Application Site, a rezoning planning application (Application No. Y/YL-NSW/7) for comprehensive development to include wetland restoration area with maximum plot ratio of 1.548 was approved by the Board in November 2023 and gazetted for OZP amendment on 12.7.2024.

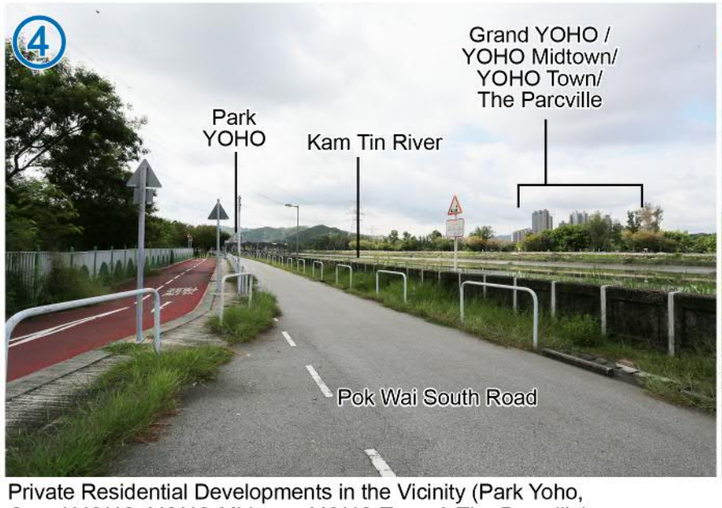
3.1.4 To the east across the San Tin Highway of the Application Site is an area zoned "Other Specified Uses" annotated "Railway Reserve" which is reserved for the future NOL. According to the Government's publication of the railway scheme for the Northern Link (NOL) in the Gazette under the Railways Ordinance in October 2023, the planned Au Tau Station will be implemented about 150m away to the east of the Application Site.



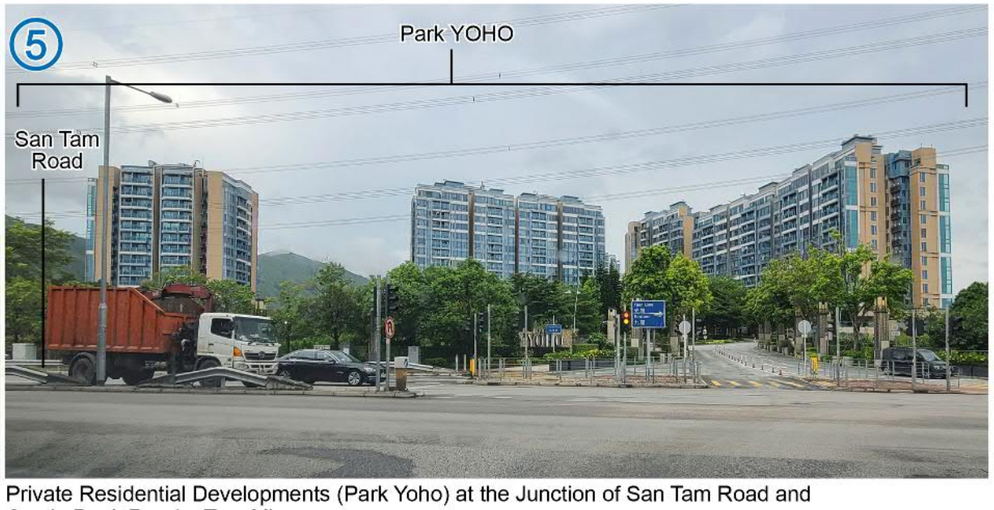
Existing Soy Sauce Factory and Container Storage Yard within the Application Site

Existing Views towards the West of the Application Site from Pok Wai South Road

Existing Brownfield Sites at the Southern Portion of the Application Site



Private Residential Developments in the Vicinity (Park Yoho, Grand YOHO, YOHO Midtown, YOHO Town & The Parcville)



Private Residential Developments (Park Yoho) at the Junction of San Tam Road and Castle Peak Road – Tam Mi

Title

Site and Surrounding Context

Checked	DH	Drawn	PW
Rev	0	Date	Feb 2025
Scale		Figure	3.1

3.1.5 According to the Approved Kam Tin North OZP No. S/YL-KTN/11, the sites (about 11.8 hectares) to the east across the San Tin Highway of the Application Site is planned for high-density and high-rise Sha Po Public Housing Development with total plot ratio up to 6.7 and building height up to 185mPD.

3.1.6 For visual assessment purpose, the abovementioned approved / planned residential developments in close proximity of the Application Site being visible from the potential VPs will be included in both "Interim Scenario" and "Ultimate Scenario" of the subject VIA.

3.1.7 To the immediate north of the Application Site is another planning application submitted to the Town Planning Board (i.e. No. Y/YL-NSW/8) in support of a comprehensive development with a domestic GFA of about 255,708m^2 and a maximum building height of about 115mPD. The proposed residential development to the immediate north of the Application Site will be included in the "Ultimate Scenario" of the subject VIA for visual assessment purpose.

3.1.8 **Figure 3.1** illustrates the existing site conditions and the surrounding context. **Table 3.1** summarises the development intensities of various existing and planned developments along the alignment of the existing Tuen Ma Line and in the vicinity of the future NOL. It is evident that the area is gradually transforming from a sub-urban area to an urban township with development intensity gradually descending towards the north across San Tin Highway, then towards the Deep Bay.

Table 3.1 - Completed, Approved and Planned Residential Developments in Close Proximity of the Application Site

Location	Zoning	Plot Ratio	Max. Building Height (excluding basement(s))
Completed Developments			
Sun Yuen Long Centre, Yuen Long	"OU"	6.71	28 storeys (104.75mPD)
Grand YOHO, Yuen Long	"CDA"	5.82	41 storeys (174.2mPD)
Twin Regency, Yuen Long	"R(E)1"	4.99	22 storeys (83.5mPD)
One Regent Place, Yuen Long	"R(B)1"	3	25 storeys (90.1mPD)
The Parcville, Yuen Long	"R(B)2"	3	15 storeys (53.65mPD)
Park Yoho, Yuen Long	"CDA"	1.024	16 storeys (60.2mPD)
Crescent Green, Yuen Long	"R(B)1"	1.199	13 storeys (83.5mPD)
The Riva, Yuen Long	"R(B)"	1.27	23 storeys (82mPD)
Approved Developments			
Sha Po Public Housing Development (Gazette on 15.12.2023)	"R(A)"	6.7	52 storeys (185mPD)
Land Sharing Pilot Scheme No. 002 at Ho Chau Road, Yuen Long (Gazette on 12.7.2024)	"R(A)1" & "R(A)2"	4.45 (Public Housing Portion) 2.16 (Private Housing Portion	26 storeys (100mPD)
Park Yoho (Phase 2), Yuen Long (No. A/YL-KTN/663 approved on 26.5.2020)	"CDA"	1.67	16 storeys (62.2mPD)
Park Yoho (Phase 3), Yuen Long (No. A/YL-KTN/604 approved on 22.3.2019)	"CDA(1)"	1.254	18 storeys (66.35mPD)
Sha Po South Extension (No. A/YL-KTN/964 approved on 15.3.2024)	"R(E)"	1.43	17 storeys (65.93mPD)

3.2 Visual Elements and Resources

3.2.1 Situated in the sub-urban area of Yuen Long between the high-rise residential development in Yuen Long Town and the medium-rise residential development along Kam Tin River, the visual context of the Application Site is shaped by various visual elements which come into sights of the viewers. All major visual elements, including the visual resources or attractors and visual eyesores or distractors that currently exist or planned are identified below. Different visual elements may enhance, degrade or neutralise the overall visual impact of the Proposed Development being assessed.

Visual Elements and Amenities

3.2.1 **Topography** – The Proposed Development lies on a flat floodplain and is overlooked by steep, vegetated mountain ranges of Lam Tsuen Country Park to the east at a further distance. The terrain to the west and northwest is an area of wetlands and the Deep Bay estuary. Some existing vacant land, scattered village developments, low-density residential estates and industrial sites are located to the north of the Application Site. The contrast between the flat plain and the hilly ridgelines creates a dramatic overall visual context to the locality.

3.2.2 **River and Ponds** – Kam Tin River are located to the west of the Application Site. The area to the north of the Application Site comprises a patchwork of fishponds, riverine and pond water surfaces and have considerable visual amenity.

Visual Eyesores and Distractors

3.2.3 **Major infrastructure** – San Tin Highway and its extensive viaducts running in a north-south direction at the eastern and south-eastern side of the Application Site are highly visible. With high volume of busy traffic flow, San Tin Highway is considered as a visual eyesore as it is incompatible with the sub-urban landscape surrounding the Application Site.

3.2.4 **Open storage yards and soy sauce buildings –** Situated in an area intermixed with urban and sub-urban landscape, the existing soy sauce building in the "I(D)" zone will be relocated to the southern portion of the Application Site. The temporary uses with open storage activities in the "OS" zone located within the Application

Site will also be phased out for development of the relocated soy sauce factory and the Proposed Development.

3.3 Assessment Area

3.3.1 An initial assessment boundary is designated with reference to the TPB PG-No. 41, which covers approximately three times the building height of the Proposed Development. As the building height of the Proposed Development is about 108m (with a site level of about 7mPD), a radius of about 320m of the initial area of visual influence and a radius of about 1.6km of the mid-long range area of visual influence from the closest point of the Proposed Development help define the boundary of the assessment area. **Figure 3.2** shows the extended assessment area which has taken into account views from other prominent viewpoints.

Approved / Planned Developments

3.3.2 The surrounding visual context includes existing and planned developments in the vicinity. In this regard, the approved indicative scheme of the surrounding approved / planned developments being visible from the potential VPs will be included in the visual analysis as well as the photomontages. These developments include:

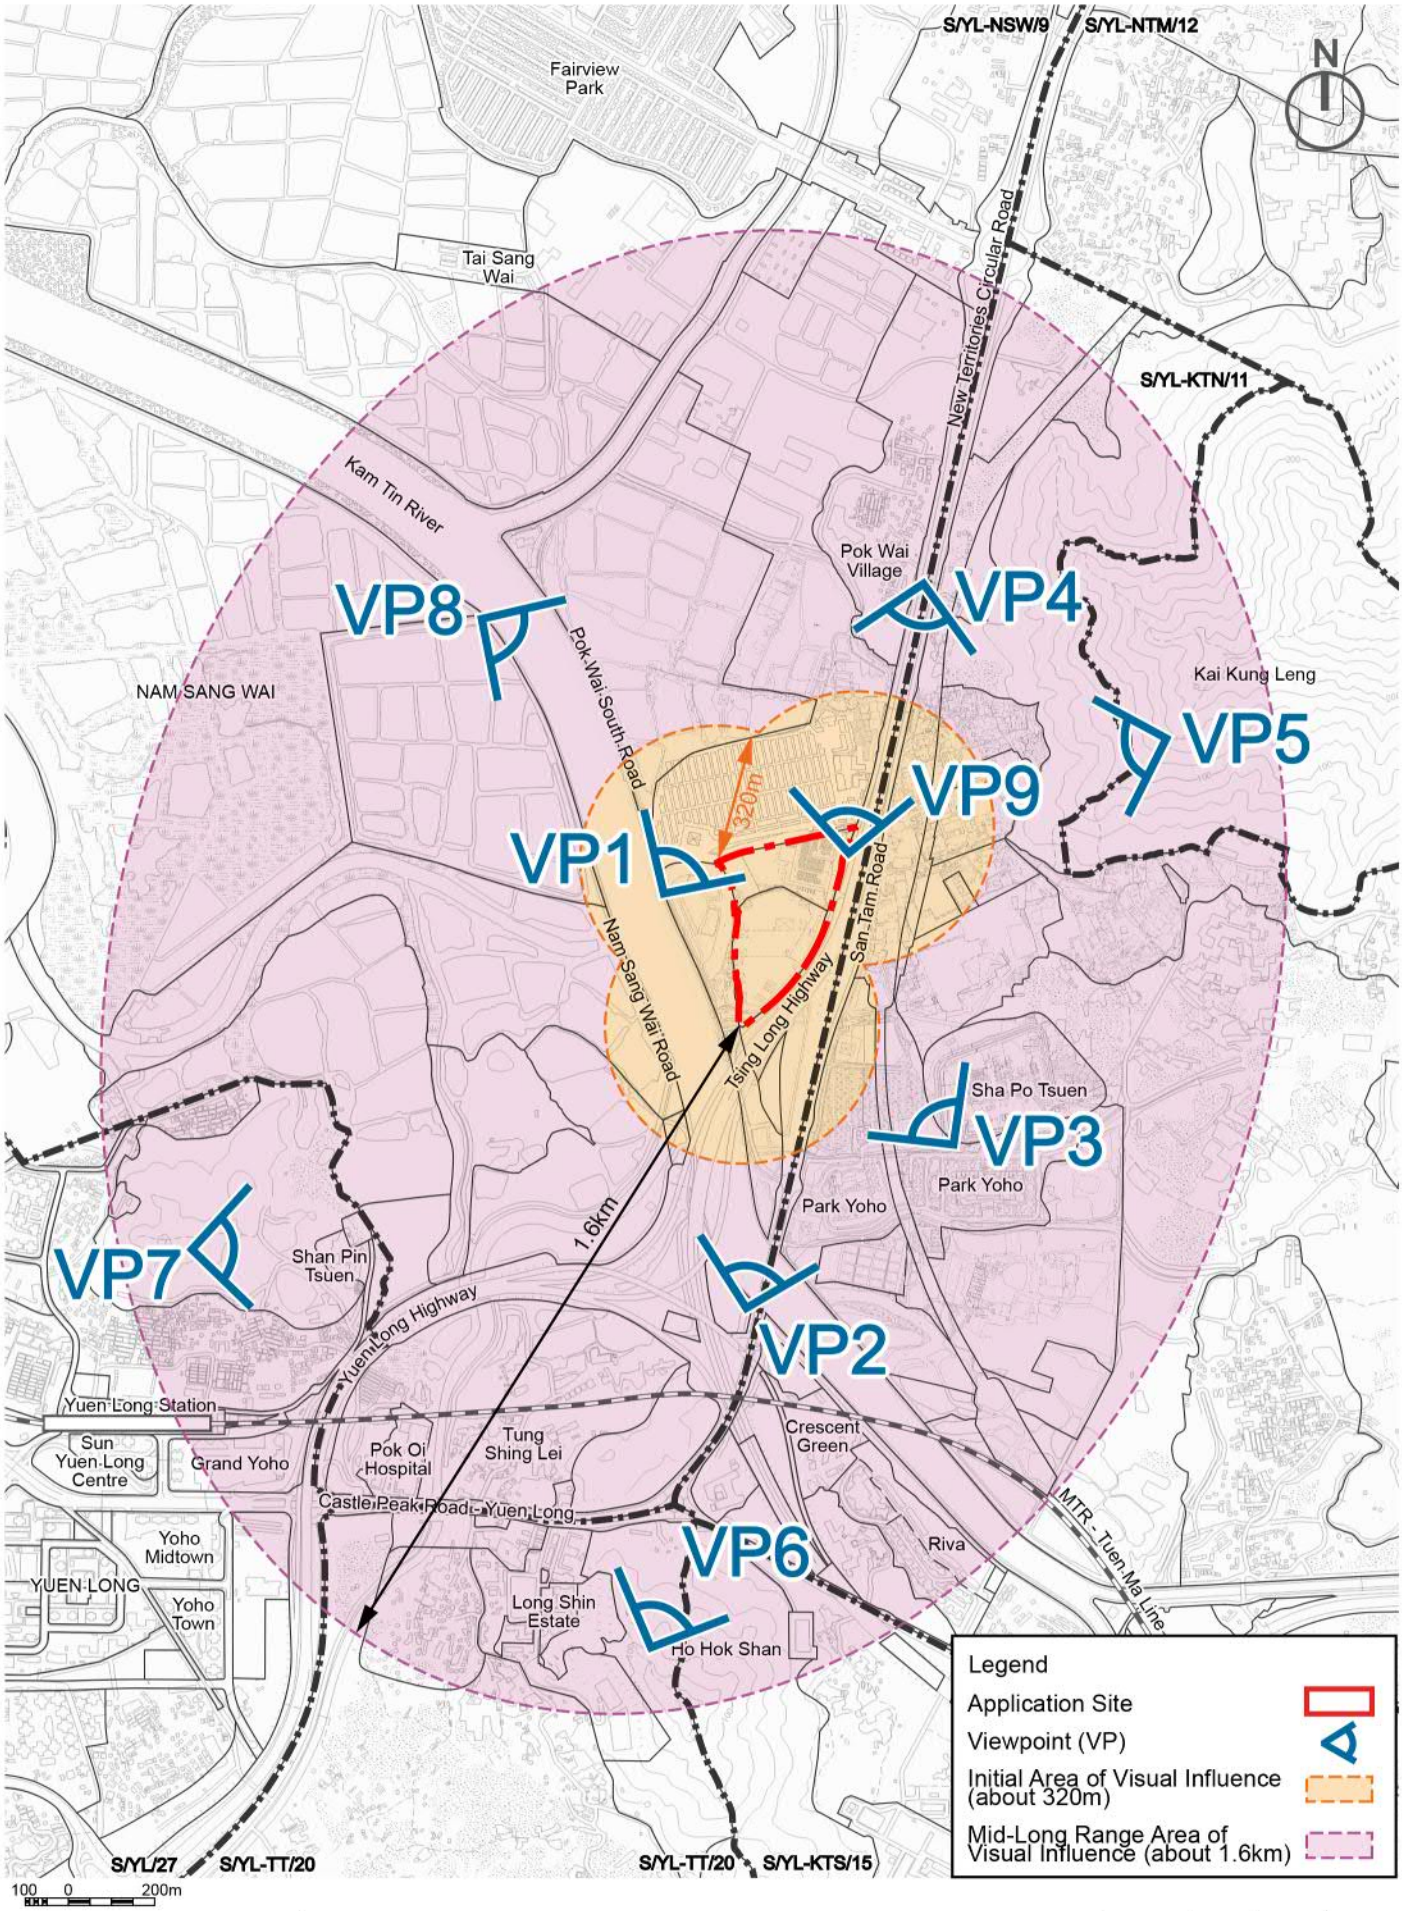
1. The approved residential development under Application No. A/YL-KTN/604 (i.e. the "CDA(1)" zone next to Park Yoho);

2. The approved residential development under Application No. A/YL-KTN/663 (i.e. the "CDA" zone next to Park Yoho);

3. The approved residential development under Application No. A/YL-NSW/274 (i.e. the "U" zone to the southwest of the Application Site);

4. The approved comprehensive development to include wetland restoration area under Application No. Y/YL-NSW/7 (i.e. the "OU(CDWRA)" zone to the north of the Application Site);

5. The gazetted Sha Po Public Housing Development (east of San Tam Road) (i.e. the "R(A)" and 'G/IC" zones to the east of the Application Site);



llewelyn davies

Title

Location of Vantage Points

Checked	DH	Drawn	PW
Rev	0	Date	Feb 2025
Scale NA		Figure 3.2	

6. The gazetted residential development at Tung Shing Lei under Land Sharing Pilot Scheme (Application No. LSPS/002) (i.e. the "R(D)" zone to the southwest of the Application Site); and

7. The planning application submitted to the Board (i.e. Y/YL-NSW/8) in support of a comprehensive development with a domestic GFA of about 255,708m^2 and maximum building height of not more than 115mPD situated to the immediate north of the Application Site.

The subject visual analysis will also take into account this ongoing proposed development to present a cumulative effect from visual point of view.

Location of Selected Public Viewpoints

3.3.3 According to the TPB PG-No. 41, the assessment area (i.e. the visual envelope) should cover the area of visual influence within which any part of the Proposed Development is visible from key sensitive viewers. When selecting the location of public viewpoints of the subject VIA, the above visual context and visual resources, the popular public recreational spaces, the distance of the development and its potential visibility from the selected viewing points, and the actual site and surrounding topographical conditions of the Application Site by ground inspection have been taken into account.

3.3.4 On top of the local vantage points, the Applicant is also aware of proposing a long-range strategic vantage point with a view to showcase the potential visual impact of the Proposed Development in a wider context. Therefore, the vantage point from Lam Tsuen Country Park, Ho Hok Shan and hill to the west of Shan Pin Tsuen were identified. In gist, 9 nos. of public viewpoints (VPs) have been identified for the subject VIA (**Figure 3.2** refers). Analysis of the visual sensitivity of the public viewers at these VPs are discussed in the following section.

4 Viewpoints and Visual Sensitive Receivers

4.1 Key VSRs are those people, who have direct views of the Application Site from the most affected public VPs, and are likely to be affected most by the visual change induced by the Proposed Development. As per the requirements of TPB PG-No. 41, the VSRs at public VPs include the public at key pedestrian nodes, popular areas for outdoor activities, recreation, rest, sitting-out, leisure, walking, sight-seeing, and the public at prominent travel routes where travellers' visual attention may be caught by the proposed visual change brought by the Proposed Development.

4.2 VSRs are also categorised based on the characters and what the public are engaged in at the public VPs. The sensitivity of receivers to visual changes will be influenced by:

1) The activities they are engaged in;
2) The duration which the Proposed Development remains visible;
3) View towards the Proposed Development is full or partial;
4) The public perception towards the Proposed Development.

4.3 With consideration to the nature of the people who are mostly affected by the proposed visual changes at the key VPs, the selected VSRs of the subject VIA are categorised into two groups, namely:-

Recreation	General public have sights to the Proposed Development while engaging in recreational facilities.
Traveller	General public have sights to the Proposed Development when commuting.

4.4 The sensitivity of VSRs towards visual changes at the Application Site are categorised into 3 classifications (i.e. "High", "Medium" and "Low"), depends on the activities they are engaged in at a VP, the duration they remain at a VP, the extent of the Proposed Development being visible at a VP, etc. For example, members of the public taking a rest at a sitting-out area for a period of time will be classified as "High Sensitivity Group", while players focusing on ball games within a playground will be classified as "Low Sensitivity Group".

4.5 The sensitivity of VSRs at the selected VPs will be described below:

Table 4.1 – Brief Analysis of Visual Sensitive Receivers at Selected Public VPs

Visually Sensitive Receiver and Type of user (Recreation and/or Traveller)	Approx. Viewing Distance	Quality of Existing View (Good / Fair / Poor)	Degree of Visibility on the Proposed Development (Full / Partial / Glimpsed / Nil) Frequency of View towards the Proposed Development (Frequent / Occasional / Rare)	Sensitivity
VSR1: Travellers along Pok Wai South Road (Figure 5.1 refers) Viewers on this road on the immediate western side of the Application Site will have views to the Proposed Development. **Traveller** – The VSRs are mainly pedestrians and drivers on Pok Wai South Road.	About 250m to the West of the Application Site	**Fair** – At this close-range VP, views towards the Proposed Development are partially available. Existing views are characterized by roadside vegetation and visually disturbing by the road itself, the pylon and handrails.	**Glimpsed** – VSRs at this VP would only have glimpsed view of the Proposed Development. Only the upper floors of the residential towers would likely be visible due to the screening effect of the existing roadside trees along Pok Wai South Road. **Rare view** – Landscape features along the Kam Tin Rive and Pok Wai South Road would attract much of the attention from people. The Proposed Development will blend in well and the views will also be screened by trees in front.	Low
VSR2: Travellers along Nam Sang Wai Road (South) (Figure 5.2 refers) Situated to the southwest of the Application Site, this VP is a crucial point of view as it signifies a visual transition from a much urbanised landscape to the south of the San Tin Highway to a relatively rural area to the north. **Traveller** – The VSRs are mainly pedestrians and drivers on Nam Sang Wai Road.	About 600m to the South of the Application Site	**Fair** – At this medium-range VP, views towards the Proposed Development would be available. Existing views are characterized by San Tin Highway, MTR's railway viaduct, some domestic structures, little vegetation and the mountain ranges from afar.	**Glimpsed** – VSR at this VP would only have glimpsed view of the Proposed Development. Only a tiny part of the upper portion of the Proposed Development would be visible above the trees top. **Occasional view** – Landscape features on along Kam Tin River would attract much of the attention from people. However, the duration for people to stay at this VP is short and hence, the nature of the VSRs is transient only.	Low
VSR3: Travellers along Sha Po Tsuen Road (Figure 5.3 refers) This road lies to the east of the Application Site, and the viewers on it are considered as one of the key public VSR groups as they represent villagers nearby. **Travellers** – The VSRs are mainly villagers from Sha Po Tsuen.	About 400m to the Southeast of the Application Site	**Fair** – At this medium-range VP, views towards the Proposed Development are obstructed by existing tree planting.	**Glimpsed** – A tiny portion of the Proposed Development will be visible in between of the vegetation under both interim and ultimate scenarios. **Rare view –** View of travellers will be largely screened off by the roadside vegetation. Travellers at this VP would also be dominated by the busy traffic such as container vehicles and trucks. The duration for people to stay at this VP is short and hence, the nature of the VSRs is transient only.	Low
VSR4: Travellers on the Footbridge on San Tin Highway near Pok Wai (Figure 5.4 refers) Situated to the east of the Application Site, it is pedestrian connection across San Tin Highway, connecting Pok Wai, Wing Kei Tsuen and Mo Fan Heung in an east-west direction. **Travellers** – The VSRs are mainly villagers from Pok Wai.	About 600m to the Northeast of the Application Site	**Fair** – The view at this VP is mainly dominated and distracted by the major highway and high volume of traffic on it. The view towards the Proposed Development is obstructed by tree planting along San Tin Highway.	**Glimpsed** – Only a very small portion of the Proposed Development will be visible in between of the vegetation under interim scenarios. Under ultimate scenario, the Proposed Development is not visible from this VP as it will be shielded by the proposed comprehensive development (under separate submission). **Rare view –** As the duration for villagers passing by this VP is short and will be concentrated on their ongoing activities. This VP is a transient view. Their views will not be much affected.	Low

Visually Sensitive Receiver and Type of user (Recreation and/or Traveller)	**Approx. Viewing Distance**	**Quality of Existing View (Good / Fair / Poor)**	**Degree of Visibility on the Proposed Development (Full / Partial / Glimpsed / Nil)** **Frequency of View towards the Proposed Development (Frequent / Occasional / Rare)**	**Sensitivity**
VSR5: Hikers at Lam Tsuen Country Park (Figure 5.5 refers) Hikers are one of the most sensitive public VSR groups as they hike specifically to appreciate good views. Hikers in this VSR group have elevated views across the Application Site. **Recreation** – The VSRs are mainly hikers at Lam Tsuen Country Park.	About 1km to the East of the Application Site	**Good** – At this medium-range VP, a distant direct views towards the Proposed Development are available. The existing view at this VP enjoys a panoramic view to Yuen Long, with mountain ranges and Yuen Long town centre as the backdrop. The existing open storage yards and rural industrial workshops at the foreground, however, distract the quality of existing view to a large extent.	**Partial –** Upon full completion of the approved and proposed development nearby, it is anticipated that the planned Sha Po Public Housing Development would appear at the foreground in front of the Application Site at this VP. The Proposed Development would be partially visible at this VP. **Frequent view –** Hikers at Lam Tsuen Country Park will frequently enjoy the panoramic view at this VP. Yet, since hikers would be much concentrated on the natural scenery and their ongoing hiking activities, they would unlikely focus their view towards the Application Site which only constitutes a small part at this view. In addition, the nature of the VSRs is transient only.	Medium
VSR6: Hikers at Ho Hok Shan (Figure 5.6 refers) Situated to the far south of the Application Site, this VSR group have elevated views looking north towards the Application Site. **Recreation** – The VSRs are mainly hikers at Ho Hok Shan.	About 1.5km to the South of the Application Site	**Good** – At this long-range VP, a distant direct views towards the Proposed Development are available. The existing view at this VP enjoys a panoramic view to Yuen Long, with Yuen Long town centre on the left and mountain ranges on the right. The existing highway infrastructure and MTR's railway viaduct, however, distract the quality of existing view of some extent.	**Glimpsed view –** Small portion of the Proposed Development would be visible at the background of this VP. **Rare view –** Due to the long distance of this VP from the Application Site, the hikers' views will not be easily affected by the possible change of visual context at the background.	Low
VSR7: Hikers at a hill to the west of Shan Pin Tsuen (Figure 5.7 refers) Situated to the far southwest of the Application Site, this VSR group have elevated views northeast towards the Application Site. **Recreation** – The VSRs are mainly hikers at the hill to the west of Shan Pin Tsuen.	About 1.2km to the Southwest of the Application Site	**Fair** – At this long-range VP, a distant direct views towards the Proposed Development are available. Existing views comprises mainly existing vegetation on the hill, graves and some existing developments (including Pok Oi Hospital) as the backdrop.	**Glimpsed view –** Other than this location, there are not many spots that have open view along the trail. At this VP, the gazetted residential development in Tung Shing Lei under the Land Sharing Pilot Scheme would appear in front of the Application Site, a tiny portion of the Proposed Development would be visible at the background of this VP. **Rare view –** The duration for traveller passing by this VP is short, hence this VP is a transient view.	Low
VSR8: Travellers along Nam Sang Wai River Education Trail (i.e. Nam Sang Wai Road near Nam Sang Wai Fishpond Education Kiosk) (Figure 5.8 refers) Situated to the northwest of the Application Site, the viewers along the Nam Sang Wai River Education Trail (i.e. Nam Sang Wai Road) will have views to the Proposed Development. **Travellers** – The VSRs are mainly pedestrians and drivers on Nam Sang Wai Road.	About 900m to the Northwest of the Application Site	**Fair** – The views towards the Proposed Development are partially available. Existing views are characterized by some vegetation and trees along Kam Tin River and Nam Sang Wai Road with some open sky view. However, the road itself, lamp posts, pylons, concrete barriers and roadside barriers distracts part of the view.	**Nil** – The Proposed Development will be shielded by the roadside vegetation under interim scenario. Upon completion of the approved and proposed developments, the proposed development is not visible from this VP as it will be blocked by the proposed comprehensive development (under separate submission). **Rare view** – Landscape features along the Kam Tin River and Nam Sang Wai Road would attract much of the attention from people. However, the duration for people to stay at this VP is short and hence, the nature of the VSRs is transient only.	Low

Visually Sensitive Receiver and Type of user (Recreation and/or Traveller)	**Approx. Viewing Distance**	**Quality of Existing View (Good / Fair / Poor)**	**Degree of Visibility on the Proposed Development (Full / Partial / Glimpsed / Nil)** **Frequency of View towards the Proposed Development (Frequent / Occasional / Rare)**	**Sensitivity**
VSR9: Travellers at the Bus and Minibus Stops next to the existing soy sauce factory along Castle Peak Road – Tam Mi (Figure 5.9 refers) Situated to the immediate east of the Application Site, it is one of the major bus and minibus stops to provide services to the villagers in Fung Kat Heung and the workers of existing soy sauce factory. **Travellers** – The VSRs are mainly travellers waiting for bus or minibus services at the Fung Kat Heung Bus and Minibus Stops.	About 5m to the East of the Application Site	**Fair** – At this short-range VP, views towards the Proposed Development are partially available. Existing views are characterized by roadside vegetation with some open sky view. However, the existing soy sauce factory, lamp posts and the road itself distract part of the view.	**Partial** –As this short-ranged VP, the lower floors of the Proposed Development would be visible along Castle Peak Road – Tam Mi. **Rare view** –Travellers at this VP would pay much attention on the traffic and their own activities (i.e. getting on and off the bus). The duration for people to stay at this VP is short and hence, the nature of the VSRs is transient only.	Low

5 Assessment of Visual Impacts

5.1 Methodology for the Appraisal of Visual Impact

5.1.1 With reference to the 'TPB PG-No. 41', the appraisal of overall visual impacts to VSRs can be determined by four aspects:

1) Visual composition (i.e. to assess the visual effects resulted from the change in building forms, bulk and etc.);

2) Visual obstruction (i.e. to assess whether the proposed subject matter may cause any views in the foreground or background to be intercepted);

3) Effects on visual resources (i.e. to assess the change in visual quality and character of the AVI); and

4) Effects on public viewers from key public VPs.

5.1.2 The significance of the overall visual impact to the VSRs is a synthetic analysis between the visual sensitivity of VSRs towards the Application Site and the VSRs' perception of the magnitude of change from the above four aspects. The resultant overall visual impact can be rated as 'Significantly Adverse', 'Moderately Adverse', 'Slightly Adverse' or 'Negligible' (**Table 5.1** refers).

Table 5.1 Matrix for Appraisal of Significance of Overall Visual Impact

		Sensitivity of VSRs		
		Low	**Medium**	**High**
Magnitude of Change	**Negligible**	Negligible	Negligible	Negligible
	Slight	Negligible / Slightly Adverse	Slightly Adverse / Moderately Adverse	Moderately Adverse
	Moderate	Slightly Adverse / Moderately Adverse	Moderately Adverse	Moderately Adverse / Significantly Adverse
	Substantial	Moderately Adverse	Moderately Adverse / Significantly Adverse	Significantly Adverse

Remarks: The resultant overall visual impacts are classified as negligible or negative (i.e. ranging from negligible to significantly adverse) unless the Proposed Development exhibits visual effects that enhance the visual quality.

5.1.3 According to 'TPB PG-No. 41', the classification of the significance of the overall visual impacts and its associated descriptions are set out in **Table 5.2** below.

Table 5.2 Classification of Overall Visual Impacts

Classifications	Descriptions
Significantly Adverse	The Proposed Development will in overall terms cause serious and detrimental visual impacts on most of the identified key public VPs even with mitigation measures.
Moderately Adverse	The Proposed Development will, with or without mitigation measures, result in overall terms in negative visual effects to most of the key identified key public VPs.
Slightly Adverse	The Proposed Development will, with or without mitigation measures, result in overall terms in some negative visual effects to most of the identified key public VPs.
Negligible	The Proposed Development will, with or without mitigation measures, in overall terms have insignificant visual impacts on most of the identified key public VPs, or the visual effects would be screened or filtered by other distracting visual elements in the assessment area.
Partly Enhanced / Partly Adverse	The Proposed Development will exhibit enhanced visual effects to some of the identified key public VPs and at the same time, with or without mitigation measures, exhibit adverse visual effects to some other key public VPs.
Enhanced	The Proposed Development in overall terms will improve the visual quality and complement the visual character of its setting from most of the identified key public VPs.

5.2 Appraisal of Visual Impacts on Different VSRs

5.2.1 The appraisal of visual impacts on VSRs at the key VPs induced by the Proposed Development are described below. The corresponding photomontages are attached in **Figures 5.1 to 5.9**. A summary of the appraisal is set out in **Table 5.3** at the end of this section.

5.2.2 Not only assessing the possible visual impact induced by the Proposed Development against the existing scenario, the approved / planned developments visible at various VPs will also be highlighted to demonstrate that the Proposed Development will be fully compatible with the planned development context in both interim and ultimate scenarios. The design interventions to alleviate the potential visual impact from the Proposed Development is summarised in **Figure A**.

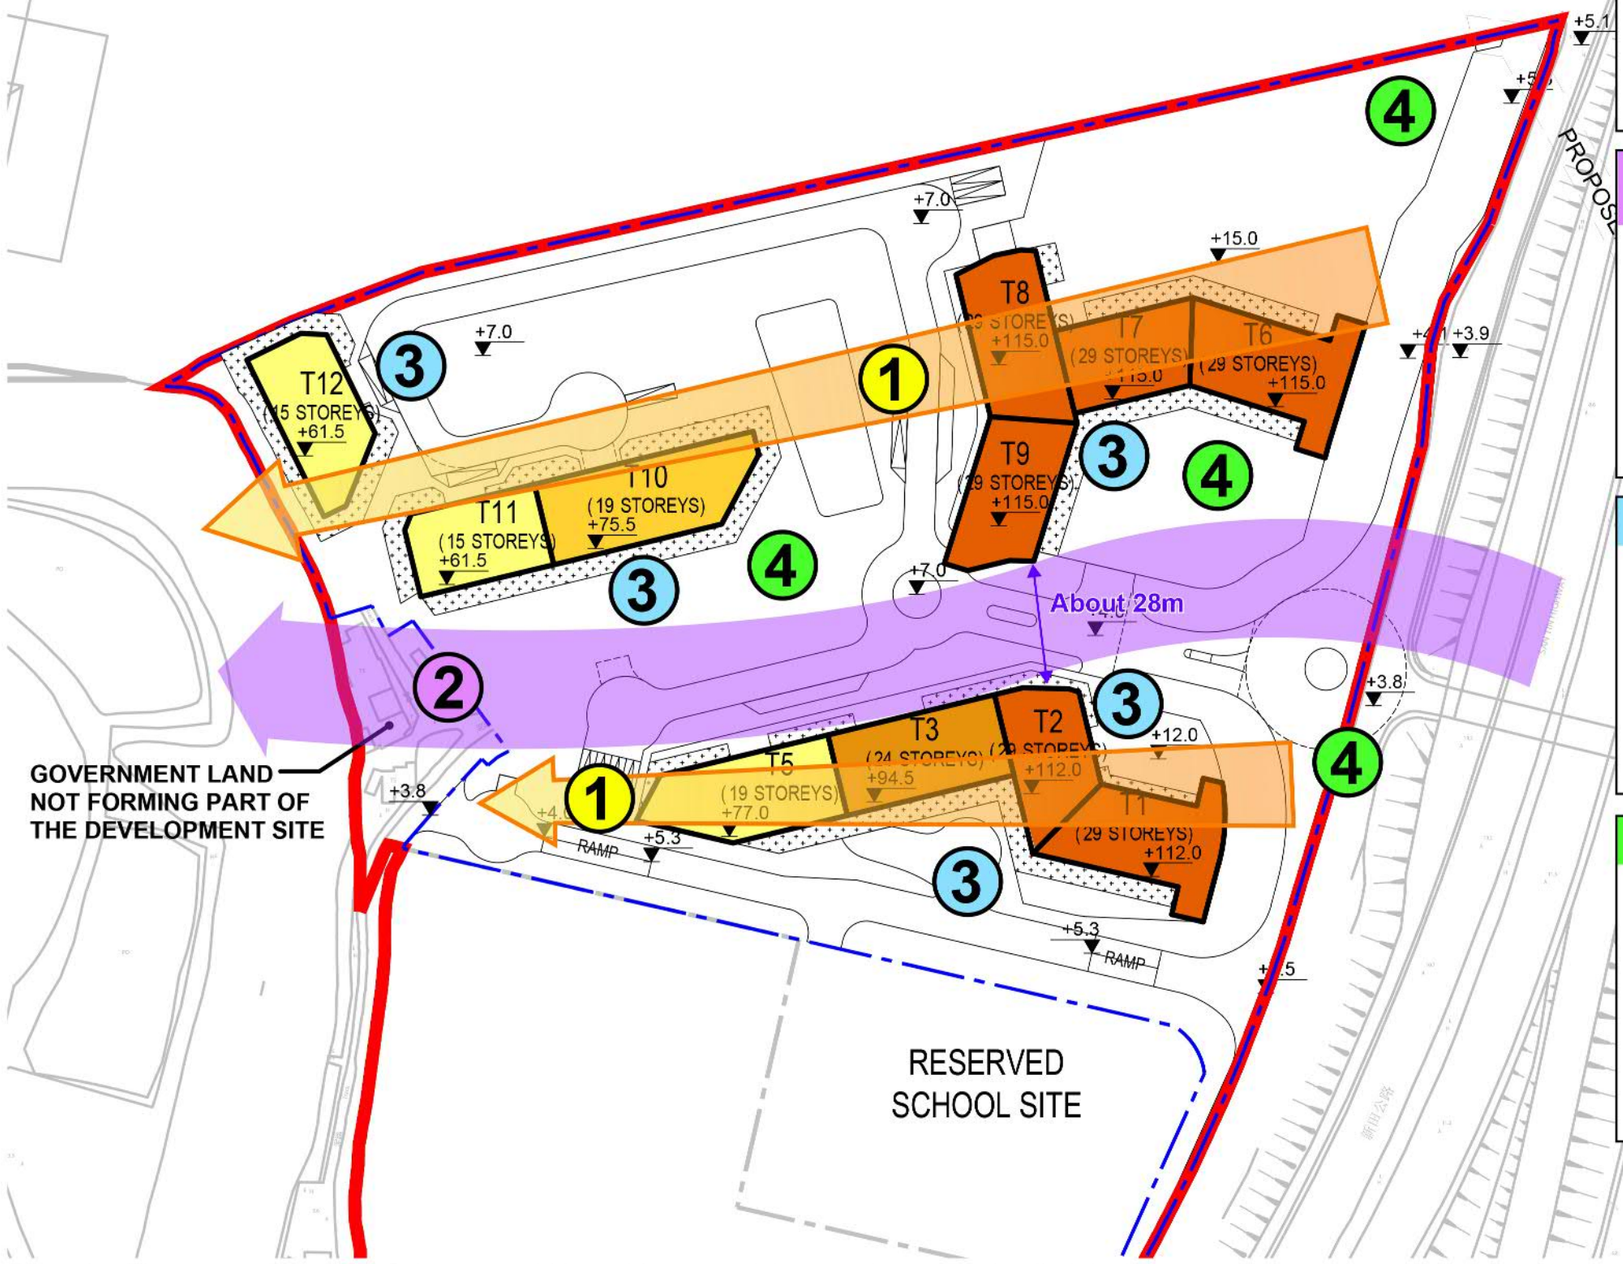
LEGEND

APPLICATION SITE BOUNDARY

DEVELOPMENT SITE BOUNDARY



① Stepped Building Height Profile

To minimise any potential impact on the existing developments nearby, a stepped building height profile within the Application Site has been proposed. The taller buildings with 29 storeys (not more than 115 mPD) located closer to Castle Peak Road in the east will descend towards the Kam Tin River in the west.

② Sensible Building Disposition with Provisions of Building Separations

Buildings are generally separated into 2 E-W running clusters with the provision of building separation to enhance visual and wind penetration.

③ Careful Façade Treatment

Careful façade treatment will be adopted so as to blend in the Proposed Development with the surroundings. For example, no extensive glass façade will be designed to avoid bird collision.

④ Landscape Treatment

To create a nature-oriented development with landscape features to be provided as below:

- Soft and hard landscape pocket spaces
- Peripheral planting strip along the Proposed Development to screen off the possible visual impact from Castle Peak Road and San Tin Highway

Remarks: The current Proposed Scheme would be subject to revision at subsequent detailed design stage.

Table 5.3 - Appraisal of Visual Impacts of Selected VSRs

Location of Key Visually Sensitive Receivers (VSRs)	**VSR Type**	**Degree of Visibility of Potential Source of Visual Impact** *(Full, Partial, Glimpsed, Nil)*	**Distance and Direction between the VPs and the Application Site**	**Visual Composition**	**Visual Obstruction and Visual Permeability**	**Effect on Visual Elements and Resources**	**Effect on Public Viewers**	**Magnitude of Visual Change** *(Negligible, Slight, Moderate, Substantial)*	**Visual Sensitivity of VSRs** *(Low, Medium, High)*	**Resultant Overall Visual Impact** *(Negligible, Slightly Adverse, Moderately Adverse, Significantly Adverse)* **Mitigation Measures (if moderately adverse or above)**
VP1: Pok Wai South Road **(Figure 5.1)**	Traveller	Glimpsed	About 250m to the West of the Application Site	The existing visual context is mainly dominated by the roadside greenery, vegetation and a pylon are available at this view. Upon completion of the Proposed Development, the upper portion of the buildings will slightly extrude on top of the roadside greenery. There is not much change of the overall visual composition at this VP for both interim and ultimate scenarios.	For both interim and ultimate scenarios, upon completion the Proposed Development, the upper portion of the buildings will appear on the top of roadside greenery and slightly obstructed the open skyview. There will be no major change to the visual permeability as the sky view remains much open.	For both interim and ultimate scenarios, upon completion of the Proposed Development, the upper portion of the buildings will be visible behind the roadside greenery and slight obstructed the open skyview. There will be no critical change to visual resources as the open sky view as the roadside greenery will still be visible at this VP.	For both interim and ultimate scenarios, no perceptible change to views is predicted. The upper portion of the buildings will slightly extrude on top of the roadside greenery. As such, the effects on public views are minimal.	Slight	Low	Slightly Adverse
VP2: Nam Sang Wai Road (South) **(Figure 5.2)**	Traveller	Glimpsed	About 600m to the South of the Application Site	The overall visual backdrop is composed by a mix of residential developments, San Tin Highway, Kam Tin River, some vegetation and sky view. Upon completion of the Proposed Development, as the existing trees shield the Proposed Development, only a small portion of Proposed Development can be seen at this VP.	For both interim and ultimate scenarios, only a very small portion of the Proposed Development will appear on the vegetation top at the background. The Proposed Development will also be compatible with the building mass of the planned Sha Po Public Housing Development. The open sky view would remain much open.	For both interim and ultimate scenarios, only a portion of the Proposed Development can be visible on top of the trees, there will be no overall negative changes on the condition, quality and character of the visual resources at this VP.	Due to the long distance of the VP from the Application Site, the views of the public will be slightly affected as some buildings may intrude above the tree tops. Overall speaking, the visual condition remains unchanged for both interim and ultimate scenarios.	Slight	Low	Negligible
VP3: Shan Po Tsuen Road **(Figure 5.3)**	Traveller	Glimpsed	About 400m to the Southeast of the Application Site	There will be no significant change of the visual composition as the Proposed Development will be largely screened off by roadside vegetation. For both interim and ultimate	A tiny portion of the Proposed Development will still be visible in between of the vegetation under both interim and ultimate scenarios. The current degree of visual permeability will remain	For both interim and ultimate scenarios, the Proposed Development will not affect the available visual elements. The existing sky view at the backdrop will also be available.	Under the interim scenario, a tiny portion of the Proposed Development will be visible in between of the vegetation, the visual impact is considered to be negligible / slightly	Negligible	Low	Negligible / Slightly Adverse

Location of Key Visually Sensitive Receivers (VSRs)	**VSR Type**	**Degree of Visibility of Potential Source of Visual Impact** *(Full, Partial, Glimpsed, Nil)*	**Distance and Direction between the VPs and the Application Site**	**Visual Composition**	**Visual Obstruction and Visual Permeability**	**Effect on Visual Elements and Resources**	**Effect on Public Viewers**	**Magnitude of Visual Change** *(Negligible, Slight, Moderate, Substantial)*	**Visual Sensitivity of VSRs** *(Low, Medium, High)*	**Resultant Overall Visual Impact** *(Negligible, Slightly Adverse, Moderately Adverse, Significantly Adverse)* **Mitigation Measures (if moderately adverse or above)**
				scenarios, the Proposed Development could barely be seen from this direction and will be shielded by the roadside vegetation.	similar upon completion of the Proposed Development under the Interim Scenario. In particular, under the ultimate scenario, the visual context will be transformed into a more urbanised context. The visual impact induced by the Proposed Development is considered to be insignificant.		adverse. Under the ultimate scenario, the visual context will be transformed into a more urbanised context. The overall visual impact is considered to be insignificant.			
VP4: Footbridge on San Tin Highway near Pok Wai (**Figure 5.4**)	Traveller	Glimpsed	About 600m to the Northeast of the Application Site	The existing visual context is largely dominated by the San Tin Highway and the roadside landscape along San Tin Highway. Under the interim scenario, upon completion of the Proposed Development, a portion of the development will appear at the back of the roadside trees. Under the Ultimate Scenario, the Proposed Development is not visible at this VP, it will be blocked by another on-going application. The planned Sha Po Public Housing Development will be located opposite to the Proposed Development and the Approved Development in Wing Kei Tsuen (No. Y/YL-NSW/7) will also be located next to the Proposed Development. The Proposed Development is considered to be compatible	The major portion of the Proposed Development will be screened off by the roadside vegetation. Upon completion of the Proposed Development, the open sky view may be slightly affected for both the interim and ultimate scenarios.	There are limited visual resources at the VP as the road side vegetation and greenery in between along San Tin Highway. The heavy traffic along San Tin Highway are one of the major visual eyesores at this VP. Although the Proposed Development will be visible on top of the roadside vegetation, the overall visual impact on visual elements are considered acceptable for both the interim and ultimate scenarios.	This VP is mostly pedestrians walking pass the footbridge and hence their duration of stay is extremely short and their eye sight would also be easily distracted by the heavy traffic along San Tin Highway. As a result, the effects on the public viewers are considered acceptable for both the interim and ultimate scenarios. In particular, upon the completion of the nearby Sha Po Public Housing Development and the Approved Development in Wing Kei Tsuen (No. Y/YL-NSW/7), the overall visual context will be transformed into a more urbanised environment. The Proposed Development will not induce any significant	Slight	Low	Slightly Adverse

Location of Key Visually Sensitive Receivers (VSRs)	**VSR Type**	**Degree of Visibility of Potential Source of Visual Impact** *(Full, Partial, Glimpsed, Nil)*	**Distance and Direction between the VPs and the Application Site**	**Visual Composition**	**Visual Obstruction and Visual Permeability**	**Effect on Visual Elements and Resources**	**Effect on Public Viewers**	**Magnitude of Visual Change** *(Negligible, Slight, Moderate, Substantial)*	**Visual Sensitivity of VSRs** *(Low, Medium, High)*	**Resultant Overall Visual Impact** *(Negligible, Slightly Adverse, Moderately Adverse, Significantly Adverse)* **Mitigation Measures (if moderately adverse or above)**
				with the overall visual context.			change to the public viewers at this VP.			
VP5: Lam Tsuen Country Park (**Figure 5.5**)	Recreation	Partial	About 1km to the East of the Application Site	The existing view is an open view towards Nam Sang Wai. Under both interim and ultimate scenarios, upon completion of the planned public and private developments in the area, the Proposed Development will be a minor portion of the urbanised view. The building mass of the Proposed Development will be visually perceived as a logical extension of the existing development in Yuen Long towards the Sha Po area. As such, the Proposed Development will not affect the harmonious visual composition from this VP.	The existing visual linkage at this VP is dominated by the natural resources including the mountain and the sky. Under both interim and ultimate scenarios, the degree of visual permeability will be altered by the by the Approved Development in Wing Kei Tsuen (No. Y/YL-NSW/7) next to the Proposed Development and the planned Sha Po Public Housing Development at the foreground and part of the Proposed Development will be blocked by the Sha Po Public Housing Development. Due to the scale and extent of the Proposed Development, the visual permeability would not be significantly hampered. The Proposed Development will also be compatible with the building mass of the planned public and private developments in the area. The views towards the sky at the backdrop will be largely retained. The impact on visual permeability is considered acceptable.	Fair amount of visual resources including the, extensive vegetation, coupled with the open sky view at the background are available at this VP. Number of open storage sites are also available when viewing from this VP, which are considered to be visual eyesores. For both interim and ultimate scenarios, the sky view and some of the vegetation at the foreground will remain. The degree on effect on visual elements are considered to be insignificant.	Under both interim and ultimate scenarios, the area will be gradually transformed from the existing context to urban high-rise context after the implementation of the planned public and private developments in the area. Only a tiny portion of the Proposed Development will be visible upon the completion of the planned Sha Po Public Housing Development at the foreground. Upon full completion of the planned public and private developments nearby, the Proposed Development would not be visually prominent. The visual effects on the public views will not be significant.	Slight	Medium	Slightly Adverse

Location of Key Visually Sensitive Receivers (VSRs)	**VSR Type**	**Degree of Visibility of Potential Source of Visual Impact** *(Full, Partial, Glimpsed, Nil)*	**Distance and Direction between the VPs and the Application Site**	**Visual Composition**	**Visual Obstruction and Visual Permeability**	**Effect on Visual Elements and Resources**	**Effect on Public Viewers**	**Magnitude of Visual Change** *(Negligible, Slight, Moderate, Substantial)*	**Visual Sensitivity of VSRs** *(Low, Medium, High)*	**Resultant Overall Visual Impact** *(Negligible, Slightly Adverse, Moderately Adverse, Significantly Adverse)* **Mitigation Measures (if moderately adverse or above)**
VP6: Ho Hok Shan (**Figure 5.6**)	Recreation	Glimpsed	About 1.5km to the South of the Application Site	The existing view is an open view towards the Proposed Development across Castle Peak Road, Yuen Long/San Tin Highway, the MTR transport corridor and Kam Tin River and the associated ponds. Only a tiny portion of the building mass would be formed at the background of this view angle. Considering the long distance of this VP from the Application Site and the compatibility, the degree of visual change on visual composition is considered to be negligible for both scenarios.	The existing visual linkage at this VP is dominated by the natural resources at the foreground including the pond, the mountain and the sky. The degree of visual permeability towards the foreground would remain largely open upon the completion of the Proposed Development while views towards the sky at the backdrop will also largely be remained for both scenarios.	Large amount of visual resources including the Kam Tin River and associated ponds, extensive vegetation, coupled with the open sky view at the background will not be affected by the Proposed Development. No effects on visual elements and resources are envisaged for both scenarios.	In the context of the elevated, open, panoramic views experienced by hikers and the more visually prominent features in the foreground (including the Yuen Long/San Tin Highway, river and pond water bodies and tree planting) the magnitude of perceived visual change would be minimal for both scenarios.	Slight	Low	Negligible / Slightly Adverse
VP7: Hill to the west of Shan Pin Tsuen (**Figure 5.7**)	Recreation	Glimpsed	About 1.2km to the Southwest of the Application Site	Existing views comprise abandoned agricultural land, fish pond, rivers, woodland and trees. Upon completion of the Proposed Development, the Proposed Development will be blocked by the gazetted residential development in Tung Shing Lei under the Land Sharing Pilot Scheme, only a tiny portion will appear in between the trees. The Proposed Development will not induce significant change in terms of visual composition for both scenarios.	Only a small portion of the buildings will appear in between the trees and blocked by the residential development in Tung Shing Lei under the Land Sharing Pilot Scheme, the open sky view will be retained for both scenarios.	Large amount of visual resources including the Kam Tin River and associated ponds, extensive vegetation, coupled with the open sky view at the background will not be affected by the Proposed Development. No effects on visual elements and resources are envisaged for both scenarios.	Considering the long distance between the Application Site and the VP, the context of the elevated, open, panoramic views experienced by hikers, and the view is of the short duration and infrequent, the magnitude of perceived visual change would negligible for both scenarios.	Slight	Low	Negligible

Location of Key Visually Sensitive Receivers (VSRs)	**VSR Type**	**Degree of Visibility of Potential Source of Visual Impact** *(Full, Partial, Glimpsed, Nil)*	**Distance and Direction between the VPs and the Application Site**	**Visual Composition**	**Visual Obstruction and Visual Permeability**	**Effect on Visual Elements and Resources**	**Effect on Public Viewers**	**Magnitude of Visual Change** *(Negligible, Slight, Moderate, Substantial)*	**Visual Sensitivity of VSRs** *(Low, Medium, High)*	**Resultant Overall Visual Impact** *(Negligible, Slightly Adverse, Moderately Adverse, Significantly Adverse)* **Mitigation Measures (if moderately adverse or above)**
VP8: Nam Sang Wai River Education Trail (i.e. Nam Sang Wai Road Near Nam Sang Wai Fishpond Education Kiosk) (**Figure 5.8**)	Traveller	Nil	About 900m to the Northwest of the Application Site	The existing visual context is largely dominated by the carriageway, roadside vegetation with an open sky view along Kam Tin River and Nam Sang Wai Road. Under the interim scenario, the Proposed Development will be shielded by the roadside vegetation. Under the ultimate scenario, the Proposed Development is not visible at this VP, it will be blocked by another on-going planning application and roadside vegetation. The planned Sha Po Public Housing Development will form a visual bulk at the background and the Approved Development in Wing Kei Tsuen (No. Y/YL-NSW/7) next to the Proposed Development will form a visual bulk. The visual context will be gradually transformed into a more urbanised context. Therefore, the Proposed Development is considered to be compatible with the overall visual context.	Under the interim scenario, the Proposed Development will be shielded by the roadside vegetation and will not be visible at this VP. The Proposed Development will be blocked by another on-going planning application and the roadside vegetation. Therefore, the visual permeability is considered to be negligible.	Under the interim and ultimate scenarios, the Proposed Development will be blocked by the roadside vegetation and by another on-going application. The Proposed Development will not be visible at the VP. As such, the visual resources such as roadside vegetation as well as the skyview at the background will still be retained.	Upon the completion of the planned Sha Po Public Housing Development at the background, the area will be gradually transformed from the existing context to urban high-rise context. Under the interim scenario, the views of the public will not be affected as the buildings are shielded by the roadside vegetation. Under the ultimate scenario, the Proposed Development is not visible at this VP, it will be blocked by another on-going planning application. As such, the Proposed Development will not induce any significant change to the public viewers.	Negligible	Low	Negligible

Location of Key Visually Sensitive Receivers (VSRs)	**VSR Type**	**Degree of Visibility of Potential Source of Visual Impact** *(Full, Partial, Glimpsed, Nil)*	**Distance and Direction between the VPs and the Application Site**	**Visual Composition**	**Visual Obstruction and Visual Permeability**	**Effect on Visual Elements and Resources**	**Effect on Public Viewers**	**Magnitude of Visual Change** *(Negligible, Slight, Moderate, Substantial)*	**Visual Sensitivity of VSRs** *(Low, Medium, High)*	**Resultant Overall Visual Impact** *(Negligible, Slightly Adverse, Moderately Adverse, Significantly Adverse)* **Mitigation Measures (if moderately adverse or above)**
VP9: Bus and Minibus Stops next to the existing soy sauce factory along Castle Peak Road – Tam Mi (**Figure 5.9**)	Traveller	Partial	About 5m to the East of the Application Site	The existing visual context is largely dominated by the Castle Peak Road – Tam Mi, existing soy sauce factory and the roadside vegetation with an open sky view along Castle Peak Road – Tam Mi. Upon completion of the Proposed Development for both interim and ultimate scenarios, the lower floors of the Proposed Development would be visible along Castle Peak Road – Tam Mi.	For both interim and ultimate scenarios, at this short range VP, the existing soy sauce factory will be relocated under the proposed scheme while the open sky view and the roadside vegetation along Castle Peak Road – Tam Mi would be affected by the lower floors of the Proposed Development.	For both interim and ultimate scenarios, there may be some loss to the open sky views and the roadside vegetation along Castle Peak Road – Tam Mi induced by the Proposed Development. Nonetheless, the roadside vegetation and skyview at the background will still be retained.	This VP is mostly pedestrians walking pass and hence their duration of stay is extremely short and their eye sight would also be easily distracted by the heavy traffic along Castle Peak Road – Tam Mi. Considering the nature of the VSRs are mainly pedestrians passing by, they are mainly transient in nature. The overall impact to the public viewers will only be transient.	Moderate	Low	Slightly Adverse / Moderately Adverse Sensible building disposition with façade treatment and landscape strategy will be adopted to enhance the possible visual impact upon competition of the Proposed Development.

6 Conclusion

6.1 This VIA is submitted to evaluate the degree of visual impacts from major public VPs due to the Proposed Development at the Application Site.

6.2 A number of key public VPs have been selected to assess the overall visual impact of the Proposed Development. With reference to the analysis in preceding sections, and as illustrated on the photomontages taken at the selected VPs, the overall visual impacts of all VPs were mainly negligible / slightly adverse.

6.3 With incorporation of urban design considerations, such as appropriate landscape treatment, careful façade treatment, sensible building disposition and building separations to minimise façade length, it is considered that the Proposed Development would not bring significant visual impact under the existing scenario.

6.4 In conclusion, the Proposed Development is fully acceptable in visual terms under the existing condition with the approved / planned developments (i.e. interim scenario), as well as the completion of another planning application for a comprehensive development to the immediate north of the Application Site (i.e. ultimate scenario).

1 INTRODUCTION

1.1 Background

1.1.1 The Application Site is located to the south of Wing Kei Tsuen, to the east of Pok Wai South Road and Kam Tin River and to the west of Castle Peak Road – Tam Mi as shown in **Figure 1.1**.

1.1.2 The Application Site currently falls within the "Industrial (Group D)" ("I(D)") , "Open Storage" ("OS") and "Road" zones on the Approved Nam Sang Wai Outline Zoning Plan (OZP) No. S/YL-NSW/8.

1.1.3 The Applicant proposes to rezone from "I(D)","OS" and "Road" zones to "Residential (Group E)" ("R(E)") zone for comprehensive development. The northern part of the Application Site is for residential development (hereafter referred as "Proposed R(E) Site Development") with domestic plot ratio of not more than 2.5 and 3,115 flats (with average flat size of 37.2m^2). The Applicant also proposes a Reserved School Site and a Relocated Soy Sauce Factory Portion at the southern part of the Application Site.

1.1.4 It is noted that there is another planning application for rezoning the "Other Specified Uses (Comprehensive Development to include Wetland Restoration Area)" ("OU(CDWRA)") zone to "OU(CDWRA)1" zone in support of a comprehensive development (hereafter referred as "Proposed OU(CDWRA)1 Site Development") with domestic plot ratio of not more than 2.2 and 6,825 flats (with average flat size of 37.5m^2) and is submitted under separate submission.

1.1.5 AECOM was commissioned by the Applicant to prepare a Traffic Impact Assessment (TIA) report in support of the Section 12A Application for the Proposed R(E) Site Development.

1.2 Objectives

1.2.1 The main objectives of this report are as follows:-

- Outline the Proposed Development parameters and internal transport facilities;
- Review the current traffic condition in the vicinity;
- Estimate the future public transport demand of the Proposed Development;
- Estimate the potential traffic generations and attractions of the Proposed Development;
- Produce traffic forecasts on the surrounding road network at the adopted design year;
- Assess traffic impact on the surrounding road network induced from the Proposed Development;
- Provide a sensitivity test to assess the possible cumulative traffic impact if the proposed OU(CDWRA)1 site development is implemented together with the Proposed Development; and
- Develop traffic improvement proposal(s) if necessary.

1.3 Structure of TIA Report

1.3.1 Following this introductory chapter, the TIA is structured as follows:

- **Chapter 2**: Proposed Development, describes the Proposed Development schedule and its internal traffic facilities provisions, access arrangement, etc. In conjunction with the access arrangement, the widening proposal of existing Castle Peak Road would be discussed. The future public transport demand together with the required transport facility and the pedestrians/cyclists access arrangements would be discussed;
- **Chapter 3**: Existing Traffic Condition, reviews the current traffic conditions;
- **Chapter 4**: Traffic Impact Assessment, presents the traffic forecast of the Proposed Development and the results of capacity assessments of the identified critical junctions for scenarios without and with the Proposed Development. The traffic impact on a sensitivity test of both OU(CDWRA)1 and R(E) Sites would be included. In addition, a sensitivity test without the newly planned Sha Po Public Housing Development would be included;
- **Chapter 5**: Summary and Conclusion, summarizes the findings of the study and presents the conclusion of this TIA.

2 PROPOSED DEVELOPMENT

2.1 Master Layout Plan and Development Schedule

2.1.1 The indicative development schedule of the Proposed Development are shown in **Table 2.1.**

Table 2.1 Indicative Development Schedule

Development Parameters	Proposed R(E) Site Development	Proposed OU(CDWRA)1 Site Development (Under Separate Submission)
Application Site Area	81,550 m^2 • Residential Portion – 47,891 m^2 • Relocated Soy Sauce Factory Portion – 27,459 m^2 • Reserved School Site – 6,200 m^2	116,231 m^2
Domestic Portion		
Domestic GFA	115,942 m^2	255,708m^2
Domestic Plot Ratio	2.5	2.2
No. of Residential Towers	11	24
No. of Units	3,115 units	6,825 units
Anticipated Population	About 8,099 persons (1)	About 17,745 persons(1)
Average Flat Size	37.2 m^2	37.5 m^2
Non-Domestic Portion		
Non-Domestic GFA	Residential Portion: 10,300 m^2 • Covered Transport Lay-by – 6,400 m^2 • Retail – 3,900 m^2 Relocated Soy Sauce Factory Portion: 13,700 m^2	• Retail – 4,950 m^2 • Residential Care Homes for the Elderly (RCHE) – 5,400m^2 • Other GIC facilities(2)

Note:
(1) Adopting 2.6 person/ flat
(2) GIC facilities includes a Neighbourhood Elderly Centre (NEC) (NOFA: 328 sqm); proposed to be exempted from PR calculations

2.2 Development Access

2.2.1 The Application Site is currently served by Castle Peak Road – Tam Mi which is along the eastern side of the Application Site.

2.2.2 To enhance the road capacity, it is proposed to widen the existing Castle Peak Road – Tam Mi to a 10.3m wide single carriageway as shown in **Figure 2.2**. 2 vehicular access (one priority junction and one roundabout) would be provided at Castle Peak Road – Tam Mi for the residential development, Covered Transport Lay-by, Reserved School Site and existing temporary structure as illustrated in **Figure 2.2**. The proposed layouts for the two vehicular accesses are shown in **Figure 2.3** and **Figure 2.4.** For the relocated Soy Sauce Factory, the vehicular access would be maintained at Castle Peak Road – Tam Mi.

2.2.3 As shown in **Figure 2.4**, a 4-arm roundabout was proposed at the junction between Castle Peak Road – Tam Mi / Vehicular Access of R(E) Site – Residential Portion, Covered Transport Lay-by / Unnamed Road underneath San Tin Highway.

2.2.4 For Information, under separate submission for Proposed OU(CDWRA)1 Site Development, 2 vehicular accesses (one roundabout and one priority junction) are also proposed at Castle Peak Road – Tam Mi to serve residential development and the GIC facilities respectively, as illustrated in **Figure 2.2**. The proposed layouts for the two vehicular accesses are shown in **Figure 2.6** and **Figure 2.7** for reference**.**

2.3 Internal Transport Facilities

2.3.1 The parking and loading/unloading facilities of the Proposed Development will be provided in accordance with the requirements as stipulated in the latest Hong Kong Planning Standards and Guidelines (HKPSG) to cater for the transport demand. The respective requirements are summarized in **Table 2.2.**

Table 2.2 HKPSG Parking and Servicing Facilities Provisions Requirement

	HKPSG Requirements
Private Car Parking Spaces	
Private Housing – Private Car Parking Spaces	GPS x R1(1) x R2(2) x R3(3) For flat size < 40m^2 = 1 space per 4-7 flats x 0.5 x 0.75 x 1.00 = 0.375 spaces per 4-7 flats
Private Housing – Visitor Private Car Parking Spaces	5 spaces per block of more than 75 residential units
Retail – Private Car Parking spaces	1 car space per 150 – 300m^2 GFA
Kindergarten – Private Car Parking Spaces	0 to 1 car parking space per 4 to 6 classrooms
Industrial – Private Car Parking Spaces	1 space per 1,000-1,200m^2 GFA

Motorcycle Parking Spaces	
Private Housing – Motorcycle Parking Spaces	1 space per 100-150 flats
Retail – Motorcycle Parking Spaces	5% - 10% total provision for private cars
Industrial – Motorcycle Parking Spaces	5% - 10% total provision for private cars
Loading and Unloading Bay	
Private Housing – Loading and Unloading Bay	1 space for every 800 flats subject to min. 1 bay per block
Retail – Loading and Unloading Bay	1 loading/ unloading bay for goods vehicles for every 800 to 1200m^2 or part thereof, GFA
Industrial – Goods Vehicle Loading and Unloading Bay	1 goods vehicle bay per 700-900m^2 GFA, 50% of which for parking
Industrial – Container Vehicle Loading and Unloading Bay	1 container vehicle bay for site with dimensions not less than 45m x 40m
Lay-bys	
Kindergarten – Taxi / private cars lay-by	1 lay-by for taxis and private cars for every 5 to 8 classrooms
Kindergarten – Small Coaches Layby	5 lay-bys for small coaches (each 3m x 7m)
Bicycle Parking Spaces	
Private Housing – Bicycle Parking Spaces	1 space per 15 flats

Notes:
(1) For flat size under 40m^2, a demand adjustment ratio (R1) of 0.5 is adopted.
(2) An accessibility adjustment ratio (R2) of 0.75 has been adopted with the site falling into the 500m^2 radius of future Au Tau MTR Station.
(3) With a domestic plot ratio of 2.5 for the application site, a development intensity adjustment ratio (R3) of 1.0 is adopted.

2.3.2 In light of the HKPSG requirements given in **Table 2.2**, the proposed provision for the Proposed R(E) Site Development according to the development schedules are summarized in **Table 2.3**

Table 2.3 Proposed Internal Transport Facilities Provision for R(E) Site

	Parameters	Required Provision		Proposed Provision
Residential – Private Car Parking Space	3,115 Flats	FS <40m^2	167 – 293 spaces	234 spaces(1)
Residential – Visitor Private Car Parking Spaces	11 Towers	55 spaces		55 spaces
Retail – Private Car Parking Spaces	3,900m^2	13 – 26 spaces		18 spaces(2)
Kindergarten – Private Car Parking Spaces	8 Classrooms (1 Kindergarten)	1 – 2 spaces		2 spaces(3)
Relocated Soy Sauce Factory – Private Car Parking Spaces	13,700m^2	12 – 14 spaces(7)		12 spaces
		Private Car Parking Spaces		**321 spaces(4)**
Residential – Motorcycle Parking Spaces	3,115 Flats	21 – 32 spaces		25 spaces(5)
Retail – Motorcycle Parking Space	3,900m^2	1 – 2 spaces		2 spaces
Relocated Soy Sauce Factory – Motorcycle Parking Spaces	13,700m^2	1 – 2 spaces(7)		1 space
		Motorcycle Parking Spaces		**28 spaces**
Residential – Loading and Unloading Bay	11 Towers	11 bays		11 bays
Retail – Loading and Unloading Bay	3,900m^2	4 – 5 bays		4 bays(6)
Relocated Soy Sauce Factory – Goods Vehicle Loading and Unloading Bay	13,700m^2	16 – 20 bays(7)		16 bays
Relocated Soy Sauce Factory – Container Vehicle Loading and Unloading Bay	13,700m^2	1 bay(7)		1 bay
		Loading and Unloading Bays		**32 bays**
Kindergarten – Private Car / Taxi Lay-by	8 Classrooms (1 Kindergarten)	1-2 lay-bys		2 lay-bys(3)
Kindergarten – Small Coach Lay-by	1 Kindergarten	5 lay-bys (7m x 3m each)		5 lay-bys (7m x 3m each)
Residential – Bicycle Parking Spaces	3,115 Flats	208 spaces		208 spaces(7)

Notes:
(1) Global Parking Standard (GPS) of 1 car space per 5 flats adopted.
(2) A provision of 1 private car parking space per 225m^2 GFA is adopted for retail development based on the requirement in HKPSG (1 car space per 150-300m^2).
(3) High-end provisions of parking and loading/unloading facilities for kindergarten are proposed.
(4) Accessible car parking spaces will be reserved for persons with disabilities in accordance with the HKPSG.
(5) A provision of 1 motorcycle parking space per 125 flats is adopted for residential development based on the requirement in HKPSG (1 motorcycle parking space per 100-150 flats).
(6) A provision of 1 loading / unloading bay per 1,000m^2 GFA is adopted for retail development based on the requirement in HKPSG (1 loading / unloading bay per 800-1,200m^2).

(7) A provision of 1 bicycle parking space for every 15 flats with flat size smaller than 70m2 for development within a 0.5-2km radius of a rail station based on the requirement in HKPSG.
(8) Provision of parking and loading/unloading facilities for Relocated Soy Sauce Factory is adopted based on the requirement on Industrial Use in HKPSG.

2.4 Existing Public Transport Facilities

2.4.1 There are also bus stops and GMB stands along Castle Peak Road – Tam Mi near the Application Site, as summarised in **Table 2.4**.

Table 2.4 Existing Public Transport Services in Vicinity

Route No.	Origin / Destination			Frequency (min.)
Franchised Bus				
76K	Ching Ho Estate Bus Terminus	↔	Long Ping Estate B/T	20 – 30
976	Sai Wan Ho	↔	Lok Ma Chau (San Tin)	To Sai Wan Ho: 4 trips (AM Peak) To Lok Ma Chau (San Tin): 4 trips (PM Peak)
Green Mini-Bus (GMB)				
36	Yuen Long (Fook Hong Street)	↔	Tai San Wai Rural Office	10 - 15
37	Yuen Long (Fook Hong Street)	↔	Yau Tam Mei Village Office	12 - 15
38	Yuen Long (Fook Hong Street)	↔	Yau Tam Mei West (near Ho Sang Farm)	10 - 15

2.5 Transport Demand and Proposed Transport Facilities

2.5.1 MTRCL Tuen Ma Line is one of the most important mass public transport services in the Yuen Long and Kam Tin areas. Currently, the closest MTRCL Tuen Ma Line stations are Yuen Long Station and Kam Sheung Road Station.

2.5.2 Under the proposed scheme, there will be 3,115 units. By assumption of 2.6 persons / flat, the anticipated population in proposed development is about 8,099. In addition, there is another site under the S12A Planning Application No. Y/YL-NSW/8 with a total population of about 17,745 persons. Hence, by taken into consideration of the two sites, a total population of 25,844 persons would be served. Reference has been made to the published "Travel Characteristics Survey (TCS) 2011 Final Report". According to the TCS Final Report, the daily mechanised trip rate per population is 1.83 trips and the morning peak hour accounted for about 12% of the daily trips. The percentage of using public transport is about 73% of the total trips. The resultant estimated additional public transport demand for both development sites in AM peak hour is about 4,143 pax/hr (i.e. 25,844 x 1.83 x 0.12 x 0.73).

2.5.3 Public transport demand of the proposed development is 1298pax/hr (by population ratio between the 2 development sites). By assuming a 90-pax capacity of franchised buses and a 2.5 pcu factor, public bus trips generated / attracted by the proposed development are estimated to be 38pcu.

2.5.4 As stated in **Para 2.5.1**, MTRCL is the key mode of public transport in the area. It is therefore proposed to provide the future bus services to serve the Subject Site to Yuen Long Station or NT North or even the nearby future Station of Northern Link (NOL) Project which is now under detailed planning & design study.

2.5.5 A passenger count survey was conducted at existing Park YOHO, which is considered a comparable reference as the Subject Site. Based on the surveyed results, about 45% are destined to Tuen Ma Line Station, 35% via Long-haul bus service (via 268M) and 20% to Yuen Long Town Centre are identified. In view of the above, one of future bus services would definitely be destined to Tuen Ma Line Station while other long-haul bus services should also be provided. Passengers taking these long-haul bus services can also interchange with other bus routes to various districts via Tai Lam Bus Interchange. Transport lay-by should also be reserved for the provision of GMB service if required in future.

2.5.6 As the major public transport demand would be likely to be destined to Tuen Ma Line Station, circular bus service is proposed between Yuen Long Station PTI and the development site. The proposed new bus service would be a circular route with terminating point at the development site and a bus stop at Yuen Long Station PTI for passenger boarding / alighting. Currently, there are 6 bus bays provided in the Yuen Long Station PTI serving only bus routes B1, B2, K65 and N30. In view of that, one bus bay is proposed to serve for the proposed circular bus service. The proposed bus stop at Yuen Long Station would serve only for passenger boarding / alighting with no bus stacking required, as a result, there should still be capacity to accommodate the said bus stop within Yuen Long Station PTI. Taken into account the potential demand prior to completion of NOL, supplementary peak hour bus service between Kam Sheung Road Station and the development site may also be required. Service to Kam Sheung Road Station would also be a circular route with terminating point at the development site. Nevertheless, the boarding / alighting point for this proposed circular bus service can be further reviewed / discussed with TD in the subsequent detail design stage.

2.5.7 Based on the demand of 1,865 pax/hr (4,143 x 45%) and a capacity of 90 persons/bus, the proposed headway for the circular bus route to Yuen Long Station and Kam Sheung Road Station are about 5 minutes and 8 minutes respectively. The estimated total round trip journey time to Yuen Long Station is about 25 minutes, considering the proposed headway of 5 minutes, a total of 5 buses (25 min / 5 min) would be required during peak hour. For Kam Sheung Road Station, the estimated total round trip journey time is about 30 minutes, considering the proposed headway of 8 minutes, a total of 4 buses (30 min / 8 min) would be required during peak hour.

2.5.8 For long-haul bus services, the overall demand for both development sites is about 1,450 pax/hr (4,143 x 35%). Based on a capacity of 90 persons/bus, this would be equivalent to about 16 bus trips/hour. Hence 16 bus trips of long-haul bus routes to/from urban areas (such as Hong Kong Island, Kowloon East and Kowloon) are proposed during the AM / PM peak hours. Passengers taking these bus services can also interchange with other bus routes to various districts via Tai Lam Bus Interchange. Additionally, one bus route is proposed to serve the passenger demand to / from Yuen Long Area. Based on the demand of 829 pax/hr (4,143 x 20%) and a capacity of 90 persons/bus, 10 more bus trips/hour to / from Yuen Long Area are proposed during AM / PM peak hours.

2.5.9 To cater for the future transport demand, transport lay-by is proposed within the development sites. The indicative layout of proposed Transport Lay-by of RE Site is shown in **Appendix A** and its provisions are summarized in **Table 2.5**.

Table 2.5 Provisions of Transport Lay-by within Development Site

Number of Bay	Function
5 sawtooth bus bays	• Two of the bus bays serve for bus service destinated to Tuen Ma Line Stations • Three of the bus bays serve for long-haul bus services
1 double-width General Layby (~32m)	• For the provision of GMB service if required in future • Serve for taxi services and other vehicles
1 double-width General Layby (~28m)	

2.5.10 Based on a headway of 5-10 minutes and an assumption of occupancy of 90 passengers for 12.8m bus, the proposed Transport Lay-by (5 bus bays) could serve for 30-60 buses/hr and provide capacity of 2,700-5,400 passenger/hr. This would be sufficient to cater for the future public transport demand (i.e. 4,143 pax/hr). In addition, the provision of GMB services can further supplement if required in the future.

2.5.11 Subject to the future planning of public transport services, the provisions of Covered Transport Lay-by within the Application Site will allow adequate hardware facility to serve the future public transport demand generated by the proposed development.

Impact on Tuen Ma Line

2.5.12 Referring to **Section 2.5.15,** the public transport demand for Tuen Ma Line (formerly named as West Rail Line) induced by both development sites would be around 1,865 pax/hr (i.e. 4,143 x 45%) in AM peak.

2.5.13 Referring to Press Releases (2019). LCQ7: Loading of trains of West Rail Line[1], The patronage per direction of the West Rail Link in its critical link (i.e. from Kam Sheung Road to Tsuen Wan West) in year 2018 AM peak hour is 40,400 pax/hr.

2.5.14 To forecast the patronage flow in year 2034, annual growth rate was estimated with reference to 2019-based Territorial Population and Employment Data Matrix (TPEDM) data which is available in Planning Department website. **Table 2.6** below shows the planning data of Tuen Mun, Yuen Long, Tin Shui Wai, and northwest New Territories.

[1] Press Releases (2019). LCQ7: Loading of trains of West Rail Line. Retrieved from HKSAR Government, Web site: https://www.info.gov.hk/gia/general/201905/08/P2019050800304.htm)

Table 2.6 2019-based TPEDM Planning Data

Planning Data District	Year 2019	Year 2026	Year 2031
	Population	Population	Population
Tuen Mun	476,500	538,900	606,850
Yuen Long	175,150	172,350	159,850
Tin Shui Wai	279,950	283,250	276,050
Northwest New Territories	222,800	239,250	353,900
Total	**1,154,400**	**1,233,750**	**1,396,650**
Annual growth rate from year 2019 to 2026 = 0.95%			
Annual growth rate from year 2026 to 2031 = 2.51%			

2.5.15 By adopting the annual growth rate of 0.95% (from year 2018 to 2026) and annual growth rate of 2.51% (from year 2026 to year 2034), the forecasted patronage flow in the critical link (i.e. from Kam Sheung Road to Tsuen Wan West) in year 2034 AM peak hour is 53,133 pax/hr (i.e. 40,400 x $(1.0095)^8$ x $(1.0251)^8$). By adopting the demand generated from the development, the overall patronage flow is 54,998 pax/hr (i.e. 53,133 + 1,865) in year 2034 AM peak.

2.5.16 The maximum capacity of West Rail Link in year 2015 is 49,200 pax/hr. After the commissioning of the Tuen Ma Line, the MTRCL can provide services at a maximum frequency of 24 trains trips per hour by procuring more trains and enhancing signaling system, thus increasing the carrying capacity of WRL by approximately 37%[Note 1] as compared with that in year 2015 (i.e. maximum capacity = 49,200 x 1.37 = 67,404 pax/hr).

2.5.17 Hence, even with the development, the Tuen Ma Line is anticipated to be operated within capacity in year 2034.

2.6 Pedestrian / Cycling Access

2.6.1 As mentioned in **Section 2.2.2**, the existing Castle Peak Road – Tam Mi along the development site would be widened to 10.3m wide. Along this widened road section, a minimum footpath of 2.75m would be provided as shown in **Figure 2.8**. In addition, conceptual subway across Castle Peak Road / San Tin Highway / San Tam Road is proposed as shown in **Figure 2.8** to facilitate pedestrians walking to/from future Au Tau Station.

2.6.2 A 4.0m wide cycle track is also proposed to enhance cycling connectivity between existing cycle track at Pok Wai South Road and future Au Tau Station. As shown in **Figure 2.8**, the tentative cycle track would originate from the connection with Pok Wai South Road, spanning along Castle Peak Road – Tam Mi section, and would finally connect to the proposed subway across San Tin Highway.

2.7 Pedestrian Impact Assessment

2.7.1 With consideration on the various components under the proposed developments, the residential portions and the reserved school site are considered the dominant source of generation for pedestrian flow in the application site.

2.7.2 Taken into consideration the combined impact of residents' work commute trip and students' school commute trip during the AM peak, a pedestrian count survey was conducted at Castle Peak Road – Tam Mi during the AM peak hour from 07:00-09:00 on a typical weekday in September 2023. The existing flow is minimal and is as shown in **Table 2.10**.

2.7.3 To establish the future pedestrian demand at various critical footpaths, different trip rates were adopted for estimating the pedestrian generation induced by the residential portions and reserved school site in the proposed developments as shown in **Table 2.7**.

Table 2.7 Pedestrian Trip Generation Rate (For Public Transport Trips and Walk Trips)

Land Use	AM Peak	
	Generation	Attraction
Private Residential (ppl/ unit)(1)	0.72	0.16
Primary School (ppl/school) (2)	316	950

Note:
(1) Based on data record for Yuen Long Park YOHO development. Such trip generation estimation covers the pedestrian trip to/from public transport and walk trips.
(2) By assuming a standard 30 classrooms primary school. As stated in HKPSG Chapter 3, a 30-classroom primary school would have 765 students in total. With reference to the adopted modal splits in **Table 2.9**, 83% students would go to school on foot or by public transport. For conservative approach, about 50% of the students (who commute on foot or via public transport) would be accompanied by an adult.

2.7.4 Based on trip rates as shown in **Table 2.7**, and the development parameters for the residential portion and the reserved school site of the proposed development, the pedestrian generation and attraction in the morning peak has been derived as shown in **Table 2.8**.

Table 2.8 Pedestrian Trip Generation for Proposed Development (For Public Transport Trips and Walk Trips)

Site	Parameters	AM Peak	
		Generation (pph)	Attraction (pph)
RE Site	3,115 units	2,243	498
OU(CDWRA)1 Site	6,825 units	4,914	1,092
Primary School	1 unit	316	950

2.7.5 With reference the modal split data for work trips in Kam Tin area and school trips in Yuen Long District as reported in 2021 Population By-census published by the Census and Statistics Department, the assumed modal split of these pedestrian generations / attractions are summarized in **Table 2.9** below.

Table 2.9 Adopted Modal Split

Assumed Modal Split	To / From	
	Residential	Primary School
Walk	6%	26%
Public Transport	94%	57%
Private Vehicle / Special Purpose Buses	N/A(1)	17%

Note:
(1) Private vehicle has not been included in the adopted modal split for residential portion as the trip rate for estimating residential trips covers only the pedestrian trip to/from public transport and walk trips.

2.7.6 A nominal growth of 1% per annum is applied to the 2023 observed pedestrian flows to produce the 2034 reference pedestrian flows. By assuming that 80% of the public transport pedestrian trips would be destined to TI in the development, and the remaining 20% would travel to the bus stop at Castle Peak Road – Tam Mi and bus stop at San Tam Road, the additional pedestrian generation / attraction as given in **Table 2.8** were then assigned to the road network resulting in the 2034 design pedestrian flows. The location of the various critical footpath sections along Castle Peak Road are as shown in **Figure 2.9.** Based on the forecasted pedestrian flows, the footpath sections have been assessed and the results are summarized in **Table 2.10**.

Table 2.10 Summary of Pedestrian Flows at Critical Footpath Sections

Critical Footpath Section	2023 AM Peak Observed Pedestrian Flows (ped/hr)	2034 AM Peak Design Pedestrian Flows (ped/hr)	Clear Minimum Width (m)	Effective Minimum Width (m)	Flow Rate (Ped/m/min)	Level of Service (LOS)
F1	8	285	2.75	1.75	2.71	A
F2	8	285	2.75	1.75	2.71	A
F3	8	1555	2.75	1.75	14.81	A
F4	8	1555	2.75	1.75	14.81	A
F5	8	1200	2.75	1.75	11.43	A
F6	8	1310	2.75	1.75	12.48	A
F7	8	1310	2.75	1.75	12.48	A
F8	8	1310	2.75	1.75	12.48	A
F9	8	285	3.50	2.50	1.90	A
F10	8	285	2.00	1.00	4.75	A

2.7.7 As shown in **Table 2.10**, all the critical footpath sections would result in a level of service A under the 2034 design traffic pedestrian flows, which are better than the preferred upper end of LOS C as stated in TPDM and is therefore considered acceptable. The description of LOS from TPDM Volume 6 Chapter 10 is extracted and shown in **Table 2.11** for reference.

Table 2.11 Description of Level-of-Service (LOS)

LOS	Flow Rate (ped/min/m)	Description
A	≤ 16	Pedestrians basically move in desired paths without altering their movements in response to other pedestrians. Walking speeds are freely selected, and conflicts between pedestrians are unlikely.
B	16 - 23	Sufficient space is provided for pedestrians to freely select their walking speeds, to bypass other pedestrians and to avoid crossing conflicts with others. At this level, pedestrians begin to be aware of other pedestrians and to respond to their presence in the selection of walking paths.
C	23 - 33	Sufficient space is available to select normal walking speeds and to bypass other pedestrians primarily in unidirectional stream. Where reverse direction or crossing movement exist, minor conflicts will occur, and speed and volume will be somewhat lower.
D	33 - 49	Freedom to select individual walking speeds and bypass other pedestrians is restricted. Where crossing or reverse-flow movements exist, the probability of conflicts is high and its avoidance requires changes of speeds and position. The LOS provides reasonable fluid flow; however considerable friction and interactions between pedestrians are likely to occur.
E	49 - 75	Virtually, all pedestrians would have their normal walking speeds restricted. At the lower range of this LOS, forward movement is possible only by shuffling. Space is insufficient to pass over slower pedestrians. Cross- and reverse-movement are possible only with extreme difficulties. Design volumes approach the limit of walking capacity with resulting stoppages and interruptions to flow.

3 EXISTING TRAFFIC CONDITION

3.1 Local Road Network

3.1.1 The existing road network in vicinity of the Application Site is shown in **Figure 3.1**.

3.1.2 Castle Peak Road – Tam Mi provides the only access to the Application Site. Castle Peak Road – Tam Mi is a rural local road of single 2-lane carriageway running parallel to San Tin Highway on the western side, it connects Castle Peak Road – Yuen Long and Kam Tin Road at Au Tau Interchange on its southern end.

3.2 Traffic Survey

3.2.1 A total of 11 critical junctions were identified for assessment in this TIA, they are listed in **Table 3.1** and their locations are shown in **Figure 3.1**. Layouts of existing junctions are presented in **Figures 3.2** to **3.11**.

Table 3.1 Critical Junctions

Ref.	Junction	Type	Fig. No.
J4	Castle Peak Road - Tam Mi / Unnamed Road underneath San Tin Highway	Priority	**3.2**
J6	San Tam Road / Unnamed Road underneath San Tin Highway	Priority	**3.2**
J7	Castle Peak Road – Tam Mi / San Tam Road	Signal	**3.3**
J8	Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen	Priority	**3.4**
J9	Castle Peak Road – Tam Mi / Nam Sang Wai Road	Priority	**3.5**
J10	Au Tau Interchange	Roundabout	**3.6**
J11	Pok Oi Interchange	Roundabout	**3.7**
J12	Kam Tin Road / Tsing Long Highway	Signal	**3.8**
J13	Kam Tin Road / Kam Tin Bypass / Kam Ho Road Roundabout	Roundabout	**3.9**
J14	Fairview Park Interchange	Roundabout	**3.10**
J15	Castle Peak Road – Tam Mi / Kam Pok Road East	Signal	**3.11**

3.2.2 Series of manual classified traffic counts surveys were carried out on 25 May 2021 to establish the current traffic condition in the vicinity. The surveys were undertaken during 7:30am – 9:30am and 5:00pm – 7:00pm at the critical junctions as listed in **Table 3.1**.

3.2.3 The identified morning (AM) and evening (PM) peak hours are from 7:45 am to 8:45 am and from 5:45pm to 6:45pm, respectively. The 2021 observed AM and PM peak hour traffic flows are shown in **Figure 3.12 and Figure 3.13**.

3.3 Junction and Road Link Assessment

3.3.1 Junction capacity analysis was carried out for the above surveyed junctions which are located in the vicinity of the Application Site to appraise the existing traffic condition based on the 2021 observed peak hour traffic flows.

3.3.2 Based on the turning flows at the above junctions, capacity assessments were carried out in accordance with the methodology documented in the appendices of Transport Planning and Design Manual (TPDM) Volume 2 Chapter 4 for priority junction / roundabout and Volume 4 for signal junction.

3.3.3 The existing junction performances of the critical junctions are summarized in **Table 3.2**. Capacity calculation sheets are attached in **Appendix B**.

Table 3.2 Existing Junction Performance

Ref.	Junction	Indicator*	2021 Existing	
			AM Peak	PM Peak
J4	Castle Peak Road - Tam Mi / Unnamed Road underneath San Tin Highway	DFC	0.05	0.04
J6	San Tam Road / Unnamed Road underneath San Tin Highway	DFC	0.08	0.07
J7	Castle Peak Road – Tam Mi / San Tam Road	RC	17%	26%
J8	Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen	DFC	0.14	0.10
J9	Castle Peak Road – Tam Mi / Nam Sang Wai Road	DFC	0.05	0.07
J10	Au Tau Interchange	DFC	0.69	0.61
J11	Pok Oi Interchange	DFC	0.81	0.82
J12	Kam Tin Road / Tsing Long Highway	RC	22%	21%
J13	Kam Tin Road / Kam Tin Bypass / Kam Ho Road Roundabout	DFC	0.59	0.54
J14	Fairview Park Interchange	DFC	0.66	0.68
J15	Castle Peak Road – Tam Mi / Kam Pok Road East	RC	56%	90%

* DFC = Design Flow / Capacity ratio for priority junction or roundabout;
RC= Reserved Capacity for signalized junction

3.3.4 At present, all critical junctions are operating within capacity.

3.3.5 The volume to capacity (V/C) ratio of the existing road links are also reviewed and summarized in **Table 3.3**. The locations of critical road links are also illustrated in **Figure 3.1**.

Table 3.3 Existing Road Link Performance

Link Index	Road Link	Dir.	Capacity (pcu/hr)	Observed Traffic Flows			
				Traffic Flows		V/C Ratio	
				AM	PM	AM	PM
L1	San Tam Road	NB	1200(3)	510	400	0.43	0.33

		SB	5400(5)	5020	2370	0.93	0.44

Note:
(1) Road capacity for Dual 2-lane carriageway
(2) Road capacity for Dual 3-lane carriageway
(3) Road capacity for 7.3m wide Single 2-Rural Road
(4) Road capacity for Dual 3-Trunk Road
(5) Road capacity for Dual 3-Tunnel
(6) Road capacity for single lane carriageway

4 TRAFFIC IMPACT ASSESSMENT

4.1 Trip Generation of Proposed Development

4.1.1 Estimates of trip generated by the Proposed Development are derived with reference to the trip generation and attraction rates as stipulated in Annex D of Transport Planning and Design Manual (TPDM) Volume 1 Chapter 3 published by Transport Department. The adopted trip rates are presented in **Table 4.1**.

Table 4.1 Adopted Trip Rates

Land Use	Trip Rates				
	Unit	AM Peak		PM Peak	
		Gen.	Att.	Gen.	Att.
Private Housing (1) (FS=60m^2 Mean)	pcu/hr/flat	0.0718	0.0425	0.0286	0.0370
Commercial (Retail) (1)	pcu/hr/100 m^2 GFA	0.2296	0.2434	0.3100	0.3563
Kindergarten (2)	pcu/hr/class	3.17	3.17	0.083	0.083
Primary School (3)	pcu/hr/school	7	30	1	1
Hotel (1)	pcu/hr/guest room	0.1329	0.1457	0.1290	0.1546

Notes:
(1) Trip rates adopted from TPDM
(2) Based on observed trip generation rates at Zenith Kindergarten (Yuen Long) and Saint Lorraine Kindergarten (Yuen Long)
(3) Refer to DR439

4.1.2 Under approved planning application Y/YL-NSW/3, the subject site is planned as retail with 38,300m^2 GFA and a hotel with 700 guest rooms.

4.1.3 Based on the planned and proposed development as given in **Table 2.1**, the estimated trip generation of the development are presented in **Table 4.2**.

Table 4.2 Trip Generation and Attraction – Proposed R(E) Site Development

Land Use	Trip Generation/ Attractions (pcu/hr)				
	Parameters	AM Peak		PM Peak	
		Gen.	Att.	Gen.	Att.
Proposed R(E) Site Development					
Private Housing	3,115 Flats (Avg. Flat Size = 37.2m^2)	224	133	90	116
Retail	3,900 m^2	9	10	13	14
Reserved School Site (Primary School)	1 school	7	30	1	1
Kindergarten	1 kindergarten (8 classrooms)	25	25	1	1
Relocated Soy Sauce Factory(2)	13,700m^2	0	4	10	2
Total (A)	**-**	**265**	**202**	**115**	**134**
Planned OS Site Development					
Retail	38,300m^2	88	94	119	137
Hotel	700 guest rooms	94	102	91	109
Total (B)	**-**	**182**	**196**	**210**	**246**
Difference (A) – (B)	**-**	**+83**	**+6**	**-95**	**-112**

Note:
(1) Assume 8 classrooms/ kindergarten.
(2) Based on trip generation of the existing Soy Sauce Factory.

4.1.4 As shown in **Table 4.2**, a difference of 2-way traffic generation should be an increase of 89 pcu/hr and a decrease of 207 pcu/hr during the commuting AM and PM peak.

4.2 Design Year

4.2.1 The Proposed Development is tentatively scheduled for completion in 2031. According to Guidelines and Requirements of Traffic Impact Assessment (TIA) Studies, the TIA should assess at least 3 years after the planned completion of the Proposed Development. Hence, 2034 is adopted as the design year for this TIA.

4.3 Planned Junction Improvement Works

J14 – Fairview Park Interchange

4.3.1 As extracted from the feasibility study (CEDD Agreement No. CE10/2020(CE)) for Sha Po Public Housing Development enclosed in RNTPC Paper No. 9/22 for consideration by RNTPC on 9 December 2022, improvement measures were proposed at Fairview Park Interchange (J14). The approach arms of Castle Peak Road – Tam Mi (northbound), San Tin Highway Slip Road (southbound) and San Tam Road (northbound) would be widened. An additional exclusive left-turn lane is also proposed at the approach arm of San Tin Highway Slip Road (northbound) for traffic routing to Castle Peak Road – Tam Mi (southbound). The planned layout is as shown in **Figure 4.1**.

J7 – J/O Castle Peak Road – Tam Mi / San Tam Road

4.3.2 Junction improvement was proposed under approved development of Planning Application No. A/YL-NSW/241. The approaching arm of eastbound Castle Peak Road – Tam Mi would be widened to 2 lanes to enhance the junction capacity.

4.3.3 Under another approved Planning Application No. A/YL-NSW/274, a junction improvement proposal at the J/O Castle Peak Road – Tam Mi / San Tam Road (J7) is recommended as shown in **Figure 4.2** to allow U-turn movement from Castle Peak Road – Tam Mi northbound to southbound.

4.3.4 Under the feasibility study (CEDD Agreement No. CE10/2020(CE)) for Sha Po Public Housing Development, it is proposed to convert the J/O Castle Peak Road – Tam Mi / San Tam Road (J7) from existing signal-controlled junction into a roundabout arrangement. The planned layout of the roundabout is as shown in **Figure 4.3**.

J8 – J/O Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen

4.3.5 A signalising proposal for the junction of Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen (J8) was proposed under approved Planning Applications No. A/YL-KTN/604 and A/YL-KTN/663. In the improvement scheme, right-turning traffic movement from northbound Castle Peak Road – Tam Mi to the unnamed access road to Cheung Chun San Tsuen is allowed. The planned junction improvement for J8 is also shown in **Figure 4.4.**

J9 – J/O Castle Peak Road – Tam Mi / Nam Sang Wai Road

4.3.6 A signalising proposal for the junction of Castle Peak Road – Tam Mi / Nam Sang Wai Road (J9) was proposed under Tung Shing Lei Land Sharing Pilot Scheme Development. With the implementation of such junction improvement scheme, right-turn movement from Nam Sang Wai Road eastbound to Castle Peak Road – Tam Mi southbound would be allowed. The planned improvement scheme for J9 is as shown in **Figure 4.5**.

J10 – Au Tau Interchange

4.3.7 An improvement measure for Au Tau Interchange was proposed under the feasibility study (CEDD Agreement No. CE10/2020(CE)) for Sha Po Public Housing Development, the approach arm at Castle Peak Road – Yuen Long EB direction is proposed to be widened and be provided with one additional entry lane.

4.3.8 Under another approved Planning Application No. A/YL-KTN/604, it is proposed to widen Castle Peak Road SB direction so as to provide an exclusive left turn lane from Castle Peak Road SB into Kam Tin Road EB. The planned layout of Au Tau Interchange is as shown in **Figure 4.6.**

J11 – Pok Oi Interchange

4.3.9 According to the LegCo Paper for Panel on Housing (LC Paper No. CB(1)276/20-21 (01)) dated 2 November 2020, an exclusive left turn lane at Pok Oi Interchange for the left turn from Castle Peak Road to Yuen Long Highway was recommended to improve the junction performance. The planned improvement works was carried out by CEDD and has been completed in 2022. In addition, according to the proposal which was presented to Traffic and Transport Committee of the Yuen Long District Council, there is a planned road improvement works at Pok Oi interchange for providing traffic signals at approaches from Yuen Long Highway. The planned improvement scheme is shown in **Figure 4.7**.

J12 – J/O Kam Tin Road / Tsing Long Highway Slip Road

4.3.10 Local road widening of the 3 approaching arms namely Kam Tin Road eastbound, Kam Tin Road westbound and slip road from Tsing Long Highway were gazetted by the Government in March 2016. The roadworks has been commenced in 2018.

J13 – J/O Kam Tin Road / Kam Tin Bypass / Kam Ho Road

4.3.11 A new segregated left turning lane from Kam Ho Road northbound to Kam Tin Road westbound and local widening of Kam Tin Road westbound were gazetted by the Government in March 2016. The roadworks has been commenced in 2018.

4.4 Traffic Forecast

4.4.1 Apart from the Proposed Development, the other major newly completed and committed/planned developments in the vicinity of the Proposed Development would also be taken into account in the traffic forecast. All these future developments are listed in **Table 4.3.**

Table 4.3 Other Key New Completed and Future Developments in the Vicinity

Ref.	Development	Key Development Parameters	Estimated 2-way Trip Generation (pcu/hr)	
			AM Peak	PM Peak
1	Kam Tin West Outlet Mall (A/YL-NSW/241) (Planned OU(CDWRA) Site Development (under separate submission))(1)	• 37,171m^2 retail GFA	177	249
2	Tung Shing Lei Development (A/YL-NSW/274)	• 1518 private residential units (average flat size = about 46m^2)	174	101
3	Sha Po North Phase 2 Residential Development (A/YL-KTN/663)	• 1,154 private residential units (average flat size = about 42.57m^2)	58(2)	32(2)

13	Wing Kei Tsuen Development (Y/YL-NSW/7)	• 1,997 private residential units • (average flat size = 48.9 m^2)	230	130
14	Yau Mei San Tsuen Residential Development (A/YL-MP/247)	• 105 private residential units • (average flat size = about 155 m^2)	47	39

Ref.	Development	Key Development Parameters	Estimated 2-way Trip Generation (pcu/hr)	
			AM Peak	PM Peak
15	Mai Po Residential Development (A/YL-MP/287)	• 65 private residential units • (average flat size = about 115 m^2)	24	20
16	Mai Po Residential Development (Y/YL-MP/3)	• 106 private residential units (average flat size = 162.5 m^2)	49	44
17	Mai Po Residential Development (A/YL-MP/205)	• 71 private residential units (average flat size = 186 m^2)	33	29
18	Wo Sang Wai Residential Development (A/YL-MP/344)	789 private residential units (average flat size = about 105 m^2)	243	179

Note:
(1) Estimated trip generation are included only for base case (reference and design) assessment, to be excluded in the sensitivity test assessment where the trip generation of the proposed development at the Proposed OU(CDWRA)1 Site are adopted.
(2) Additional traffic in addition to the development under application no. A/YL-KTN/118-2 (Source: http://www.tpb.gov.hk)
(3) 80% of the development completed.
(4) An assumption of 70% / 30% split for Public Rental Housing (PRH) and Home Ownership Scheme (HOS) is adopted for trip generation calculation.
(5) Trip Generation includes Sha Po PHD public transport trips

Future Traffic Flows

4.4.2 For projection of background traffic flows in Area of Influence, an in-house 2-tier modelling approach (Strategic Transport Model (STM) and Local Area Traffic Model (LATM)) have been adopted. Based on the planning data published on the website of Planning Department (i.e. 2019-based TPEDM Planning Data), together with other information (such as population distribution and employment type from Census) available in public domain, a simplified Strategic Transport Model (STM) was developed for cordoning board vehicle trip matrices for local area traffic modelling.

4.4.3 For the Local Area Traffic Model (LATM), the Base District Traffic Model (BDTM) "NTW1" covering Tuen Mun and Yuen Long Area has been adopted as the base traffic model for this study.

4.4.4 The LATM has been validated against the 2021 traffic data in the area of influence to ensure that the base year LATM could satisfactorily replicate the base year traffic patterns and volumes before the model is used to produce future years traffic forecasts.

4.4.5 The 2018 / 2031 STM cordoned matrices were fed into the LATM for projecting the traffic flows from year 2021 to year 2034. In addition, the trip ends of traffic zones were adjusted and controlled to the estimated trips generated by the future developments in the vicinity as listed in **Table 4.2 (Planned OS Site Development)** and **Table 4.3** to produce the 2034 reference traffic flows as shown in **Figure 4.8 and 4.9.**

4.4.6 The additional trip ends due to proposed development with proposed scheme as estimated in **Table 4.2 (Proposed R(E) Site Development)** are then added to 2031 reference traffic flows to produce 2034 design traffic flows. **Figure 4.10 and 4.11** presents 2034 design traffic flow (with Proposed Scheme). **Figure 4.12 and 4.13** presents the overall development traffic flows for the Proposed Development.

4.5 Junction and Road Link Assessment

4.5.1 The main criteria for assessing the traffic impact of critical junctions is whether the additional traffic generated would affect the capacity of junctions in the vicinity of the Proposed Development.

4.5.2 The operational performances of the 15 critical junctions as identified in **Section 3** were assessed based on the traffic forecast and the planned junction improvement schemes as mentioned in **Sections 4.3**. The results are summarized in **Table 4.4**. The junction calculation sheets are shown in **Appendix B.**

Table 4.4 2034 Junction Performance

J14(7)	Fairview Park Interchange	DFC	1.10	1.08	1.11	1.08
J15	Castle Peak Road – Tam Mi / Kam Pok Road East	RC	35%	46%	26%	59%

* DFC = Design Flow / Capacity ratio for priority junction or roundabout;
RC= Reserved Capacity for signalized junction
Note:
(1) New junctions formed under proposed widening of Castle Peak Road – Tam Mi.
(2) Existing Junction Layout (refer to **Figure 3.2**)
(3) Planned Junction Layout (refer to **Figure 4.4)**
(4) Planned Junction Layout (refer to **Figure 4.5)**
(5) Planned Junction Layout (refer to **Figure 4.6**)
(6) Planned Junction Layout (refer to **Figure 4.7**)
(7) Planned Junction Layout (refer to **Figure 4.1**)

4.5.3 As shown in **Table 4.4**, all the assessed junctions except Au Tau Interchange (J10) and Fairview Park Interchange (J14) be able to handle the future traffic demand with all planned improvement works implemented timely. Particularly, the roundabout of Castle Peak Road – Tam Mi / Vehicular Access of R(E) Site – Residential Portion, Covered Transport Lay-by / Unnamed Road underneath San Tin Highway (J4) and the junction of San Tam Road / Unnamed Road underneath San Tin Highway (J6) would operate with ample capacity under the future traffic demand, additional analysis were also carried out and have demonstrated that the vehicle queues at these two junctions would not interfere with each other.

Improvement Recommendation –

J7 – Castle Peak Road – Tam Mi / San Tam Road

4.5.4 As mentioned in **Section 4.3**, planned improvement measures were proposed to Castle Peak Road / San Tam Road (J7) under the feasibility study (CEDD Agreement No. CE10/2020(CE)) for Sha Po Public Housing Development. The planned improvement is to convert the existing signalized junction into roundabout. To maximize the junction capacity of J7, as well as facilitating access towards the Proposed OU(CDWRA)1 Site Development and Proposed R(E) Site Development, a segregated left turn lane to/from Castle Peak Road – Tam Mi is introduced. The proposed layout of the segregated left turn lane is as shown in **Figure 4.14**.

4.5.5 In case of programme mismatch between planned improvement measures proposed under CE10/2020(CE), coordination of construction schedule of the proposed segregated left turn lane to/from Castle Peak Road will be liaised to facilitate a comprehensive improvement measures for J7.

J10 – Au Tau Interchange

4.5.6 As mentioned in **Section 4.3**, planned improvement measures were proposed to Au Tau Interchange (J10) under the feasibility study (CEDD Agreement No. CE10/2020(CE)) for Sha Po Public Housing Development and the previous approved planning application A/YL-KTN/604. Additional junction improvement proposal to Au Tau Interchange is recommended to enhance the interchange capacity. The approach arms of Castle Peak Road – Tam Mi (southbound) and Kam Tin Road (westbound) would be widened to extend the segregated left turn lanes. The proposed layout is shown in **Figure 4.15**

J14 – Fairview Park Interchange

4.5.7 As mentioned in **Section 4.3**, planned improvement measures were proposed to Fairview Park Interchange (J14) under the feasibility study (CEDD Agreement No. CE10/2020(CE)) for Sha Po Public Housing Development. Additional junction improvement proposal to Fairview Park Interchange (J14) is recommended to enhance the junction capacity. The proposed improvement measures implement by subject application is shown in red and presented in **Figure 4.16.**

4.5.8 Capacity analysis for the affected junctions due to the improvement works were carried out and the results are presented in **Table 4.5**. The junction calculation sheets are shown in **Appendix B.**

Table 4.5 2034 Junction Performance with Proposed Junction Improvement Works

Ref.	Junction	2034 DFC*	
		Design Case (With Improvement)	
		AM Peak	PM Peak
J7(1)	Castle Peak Road – Tam Mi / San Tam Road	0.69	0.54
J10(2)	Au Tau Interchange	0.83	0.74
J14(3)	Fairview Park Interchange	0.82	0.80

* DFC = Design Flow / Capacity ratio for priority junction or roundabout
Note:
(1) Proposed Junction Layout shown in **Figure 4.14**
(2) Proposed Junction Layout shown in **Figure 4.15**
(3) Proposed Junction Layout shown in **Figure 4.16**

4.5.9 As shown, the performance for J10 and J14 will be improved and operating within capacity upon completion of the proposed improvement works.

4.5.10 Based on the future traffic flows, the critical road links have been assessed and the results are summarized in **Table 4.6**.

Note:
(1) Road capacity for Dual 2-lane carriageway
(2) Road capacity for Dual 3-lane carriageway
(3) Road capacity for 7.3m wide Single 2-Rural Road
(4) Road capacity for 15m wide Single 4-Rural Road
(5) Road capacity for 10.3m wide Single 2-Rural Road
(6) Road capacity for Dual 3-Trunk Road
(7) Road capacity for Dual 3-Tunnel
(8) Calculated with road capacity for 7.3m wide Single 2-Rural Road before widening
(9) Road capacity for single lane carriageway
(10) Based on available information and our preliminary evaluation, it is anticipated that Tai Lam Tunnel (L15) would yield a volume-to-capacity ratio (V/C) below 1.0, while San Tin Highway (L14) would be below 1.1 upon completion of Route 11. Yet for conservative approach, the current road link assessment illustrated in the TIA report demonstrates the road link assessments with the worst-case scenario assumption without Route 11.

4.5.10 The assessment results in **Table 4.6** indicated that all the above road links are expected to operate within capacity except San Tin Highway (L14) and Tai Lam Tunnel (L15). With opening of future Route 11, it was anticipated that the traffic condition of both San Tin Highway and Tai Lam Tunnel could be significantly improved. Between the year 2031 (completion year of the development) and the opening year of Route 11, the V/C ratio of both San Tin Highway and Tai Lam Tunnel would reach 1.05 and 1.17 respectively, meaning that the traffic speed would be reduced, but would still be manageable with V/C ratio under 1.2.

4.6 Cumulative Traffic Impact with Proposed Developments at OU and R(E) Site

4.6.1 As mentioned in **Section 1.1.4**, Proposed OU(CDWRA)1 Site Development would be proposed under separate application submission. In order to review the accumulated traffic impact, a sensitivity test has been carried out for the scenario that both developments (i.e. Proposed R(E) Site Development and Proposed OU(CDWRA)1 Site Development) are completed.

4.6.2 The trip generation and attraction for Proposed OU(CDWRA)1 Site Development is derived in **Table 4.7**.

Table 4.7 Trip Generation and Attraction – Proposed OU(CDWRA)1 Site Development

Land Use	Trip Generation/ Attractions (pcu/hr)				
	Parameters	AM Peak		PM Peak	
		Gen.	Att.	Gen.	Att.
Proposed OU(CDWRA)1 Site Development (under separate submission)					
Private Housing	6,825 Flats (Avg. Flat Size = 37.5m^2)	491	291	196	253
Retail	4,950m^2	12	12	16	18

Total	**-**	**538**	**338**	**223**	**282**
Planned OU(CDWRA) Site Development					
Retail (B)	37,171m^2	86	91	116	133
Difference (A) – (B)	-	**+452**	**+247**	**+107**	**+149**

4.6.3 With similar methodology adopted as discussed in the above section, 2034 traffic forecast for Sensitivity Test (with both Proposed R(E) Site Development and Proposed OU(CDWRA)1 Site Development) under Design case (With Proposed Scheme) is derived, as shown in **Figure 4.18 and 4.19.** The cumulative development traffic is shown in **Figure 4.25 and Figure 4.26**.

4.6.4 Operational performances of the critical junctions are assessed according to the traffic forecast. The results are summarized in **Table 4.8**. The junction calculation sheets are shown in **Appendix B.**

(7) Planned Junction Layout (refer to **Figure 4.7**)
(8) Proposed Junction Layout (refer to **Figure 4.16)**

4.6.5 A Microsimulation has been conducted to simulate the microscopic traffic condition under the planned signalising scheme at Pok Oi Interchange (J11) with this future design flow. The result of the simulation is as shown in **Appendix D**.

4.6.6 As shown in **Table 4.8**, with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions except Castle Peak Road – Tam Mi / Kam Pok Road East (J15) would be able to handle the future traffic demand under Sensitivity Test Scenario.

Further Improvement Recommendation –

Improvement Recommendation –

J15 – Castle Peak Road – Tam Mi / Kam Pok Road East

4.6.7 A junction improvement proposal to Castle Peak Road – Tam Mi / Kam Pok Road East (J15) is recommended to enhance the junction capacity. Split phases control are proposed at Castle Peak Road – Tam Mi (southbound) and Kam Pok Road East. The proposed method of control is shown in **Figure 4.17.**

4.6.8 Capacity analysis for the affected junctions due to the improvement works were carried out and the results are presented in **Table 4.9**. The junction calculation sheets are shown in **Appendix B**. As shown in **Table 4.9**, the performance for J15 will be improved and operating within capacity.

Note:
(1) Road capacity for Dual 2-lane carriageway
(2) Road capacity for Dual 3-lane carriageway
(3) Road capacity for 7.3m wide Single 2-Rural Road
(4) Road capacity for 15m wide Single 4-Rural Road
(5) Road capacity for 10.3m wide Single 2-Rural Road
(6) Road capacity for Dual 3-Trunk Road
(7) Road capacity for Dual 3-Tunnel
(8) Road capacity for single lane carriageway
(9) Based on available information and our preliminary evaluation, it is anticipated that Tai Lam Tunnel (L15) would yield a volume-to-capacity ratio (V/C) below 1.0, while San Tin Highway (L14) would be below 1.1 upon completion of Route 11. Yet for conservative approach, the current road link assessment illustrated in the TIA report demonstrates the road link assessments with the worst-case scenario assumption without Route 11.

4.6.10 The assessment results in **Table 4.10** indicated that all the above road links are expected to operate within capacity except San Tin Highway (L14) and Tai Lam Tunnel (L15). With opening of future Route 11, it was anticipated that the traffic condition of both San Tin Highway and Tai Lam Tunnel could be significantly improved. Between the year 2031 (completion year of the development) and the opening year of Route 11, the V/C ratio of both San Tin Highway and Tai Lam Tunnel would reach 1.06 and 1.19 respectively, meaning that the traffic speed would be reduced, but would still be manageable with V/C ratio under 1.2.

4.7 Sensitivity Analysis (I)

With Proposed Developments at OU Site and R(E) Site but deferred of Sha Po Public Housing Site Development Schedule

4.7.1 As mentioned in **Section 4.4.1**, some of the committed developments including Sha Po Public Housing Development in the vicinity of the Proposed Development have been taken into account in the traffic forecast. A sensitivity analysis has been carried out for the scenario when Sha Po Public Housing Development has been deferred, together with the corresponding improvement works. Assessment would be made on the traffic condition if the proposed junction improvement by Sha Po Public Housing Development cannot be implemented timely before completion of the Proposed Developments at OU Site and R(E) Site.

4.7.2 The additional traffic has been added into the 2034 design flow (with both proposed OU and R(E) developments). Traffic forecast of sensitivity analysis (I) is shown in **Figure 4.20** and **Figure 4.21**.

4.7.3 **Figure 4.24** refers to improvement scheme to be adopted for J14 under Sensitivity Analysis (I) which is similar to the improvement scheme under the design case, as presented in **Figure 4.16**. Under sensitivity analysis (I), the proposed improvement measures implement by subject application is shown in red and presented in **Figure 4.24.**

4.7.4 Operational performances of the critical junctions are reassessed according to the revised traffic forecast. The results are summarized in **Table 4.11**.

Table 4.11 2034 Junction Performance – Sensitivity Analysis (I)

J5[(1)]	Castle Peak Road - Tam Mi / Vehicular Access of R(E) Site – Reserved School Site & Existing Temporary Structure	DFC	0.09	0.02
J6[(2)]	San Tam Road / Unnamed Road underneath San Tin Highway	DFC	0.41	0.17
J7[(3)]	Castle Peak Road – Tam Mi / San Tam Road	RC	-12%	8%
J8[(4)]	Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen	RC	47%	67%
J9[(5)]	Castle Peak Road – Tam Mi / Nam Sang Wai Road	RC	45%	92%

Ref.	Junction	Indicator *	Year 2034 RC/DFC(1) Design Case (Sensitivity Test)	
			AM Peak	PM Peak
J8(4)	Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen	RC	47%	67%
J9(5)	Castle Peak Road – Tam Mi / Nam Sang Wai Road	RC	45%	92%
J10(6)	Au Tau Interchange (with Existing Flyover)	DFC	0.90	0.80
	Au Tau Interchange (without Existing Flyover)		1.18	0.83
J11(7)	Pok Oi Interchange (Signal NB)	RC	14%	20%
J12	Kam Tin Road / Tsing Long Highway	RC	26%	25%
J13	Kam Tin Road / Kam Tin Bypass / Kam Ho Road Roundabout	DFC	0.78	0.61
J14(8)	Fairview Park Interchange	DFC	0.62	0.63
J15(9)	Castle Peak Road – Tam Mi / Kam Pok Road East	RC	37%	88%

* DFC = Design Flow / Capacity ratio for priority junction or roundabout;
RC= Reserved Capacity for signalized junction
Note:
(1) New junctions formed under proposed widening of Castle Peak Road – Tam Mi.
(2) Existing Junction Layout (refer to **Figure 3.2**)
(3) Planned Junction Layout (refer to **Figure 4.2)**
(4) Planned Junction Layout (refer to **Figure 4.4**)
(5) Planned Junction Layout (refer to **Figure 4.5**)
(6) Proposed Junction Layout (refer to **Figure 4.15**), excluded the works by Sha Po Public Housing site
(7) Planned Junction Layout (refer to **Figure 4.7**)
(8) Proposed Junction Layout (refer to **Figure 4.24**)
(9) Junction improvement scheme shown in **Figure 4.17**

4.7.5 The assessment results indicate that J7 and J10 (Au Tau Interchange) would experience overload in this scenario. Consequently, it is deemed necessary to implement the following improvement measures proposed under Sha Po Public Housing Development.

- J7 Widening of San Tam Road southbound approach by removing existing hatch marking and setback of existing verge fronting Park Yoho to allow 2 nos. of full lane entering J7 (refer to **Figure 4.22**)
- Widening of Castle Peak Road – Yuen Long eastbound approach at Au Tau Interchange (refer to **Figure 4.23**);

4.7.6 Under sensitivity analysis assuming defer of Sha Po Public Housing Site Development schedule, improvement measures implemented by the subject application at J7 and J10 are presented in **Figure 4.22** and **Figure 4.23**.

4.7.7 Capacity analysis for the affected junctions due to the improvement works were carried out and the results are presented in **Table 4.12**.

Table 4.12 2034 Junction Performance – Sensitivity Analysis (I) with Proposed Junction Improvements

		AM Peak	PM Peak
J7(1)	Castle Peak Road – Tam Mi / San Tam Road	19%	49%
J10(2)	Au Tau Interchange	0.82	0.73

* DFC = Design Flow / Capacity ratio for priority junction or roundabout;
RC= Reserved Capacity for signalized junction
Note:
(4) Proposed Junction Layout shown in **Figure 4.22**
(5) Proposed Junction Layout shown in **Figure 4.23**

4.7.7 As shown, the performance for J7 and J10 will be improved and operating within capacity upon completion of the proposed improvement works.

4.7.8 It is expected that when Sha Po Public Housing Development resumed, corresponding improvement measures will be implemented as mentioned in **Section 4.5**.

4.8 Sensitivity Analysis (II)

With Potential Developments Under Planning Application no. Y/YL/MP-6, Y/YL/MP-7, Y/YL/MP-8, OU Site and R(E) Site

4.8.1 A private residential development has been proposed under planning application no. Y/YL-MP/6. Following the rejection by Town Planning Board in May 2023, it is understood that this planning application is now under review and would be re-submitted in the near future. The latest proposed development parameters (i.e. 2,322 units of flats and an average flat size of 43m^2 and several GIC facilities) is adopted for this assessment. With reference to the standard traffic generation and attraction rates for high-density / R(A) private housing as given in the Annex C of Transport Planning and Design Manual (TPDM) Volume 1 Chapter 3, a two-way traffic generation / attraction of about 393 pcu/hr and 345 pcu/hr is estimated for AM and PM peak period respectively.

4.8.2 A potential private residential development has been proposed under planning application no. Y/YL-MP/7 with 1,228 units of flats and an average flat size of 43m^2 and some GIC & retail facilities. Another potential private residential development under planning application no. Y/YL-MP/8 with 1,249 units of flats and an average flat size of 44m^2 has also been proposed. With reference to the standard traffic generation and attraction rates for high-density / R(A) private housing as given in the Annex C of Transport Planning and Design Manual (TPDM) Volume 1 Chapter 3, a two-way traffic generation / attraction for both potential developments of about 349 pcu/hr and 298 pcu/hr is estimated for AM and PM peak period respectively.

4.8.3 The additional traffic has been added into the 2034 design flow (with both proposed OU and R(E) developments). Operational performances of the critical junctions are reassessed according to the revised traffic forecast. The results are summarized in **Table 4.13**.

Table 4.13 2034 Junction Performance – Sensitivity Analysis (II)

Ref.	Junction	Indicator*	Year 2034 RC/DFC(1) Design Case (Sensitivity Test)	
			AM Peak	PM Peak
J1(1)	Castle Peak Road – Tam Mi / Vehicular Access of OU(CDWRA)1 Site - GIC Portion	DFC	0.03	0.03

J13	Kam Tin Road / Kam Tin Bypass / Kam Ho Road Roundabout	DFC	0.81	0.62
J14(8)	Fairview Park Interchange	DFC	0.96	0.89
J15(9)	Castle Peak Road – Tam Mi / Kam Pok Road East	RC	37%	88%

* DFC = Design Flow / Capacity ratio for priority junction or roundabout;
RC= Reserved Capacity for signalized junction

Note:

(1) New junctions formed under proposed widening of Castle Peak Road – Tam Mi.
(2) Existing Junction Layout (refer to **Figure 3.2**)
(3) Planned Junction Layout (refer to **Figure 4.14)**
(4) Planned Junction Layout (refer to **Figure 4.4**)
(5) Planned Junction Layout (refer to **Figure 4.5**)
(6) Proposed Junction Layout (refer to **Figure 4.15**)
(7) Planned Junction Layout (refer to **Figure 4.7**)
(8) Proposed Junction Layout (refer to **Figure 4.16)**.
(9) Junction improvement scheme shown in **Figure 4.17**

4.8.4 As shown in **Table 4.13**, with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions would be able to handle the future traffic demand under Sensitivity Test Scenario.

4.9 Sensitivity Analysis (III)

With Potential Developments Under Planning Application no. Y/YL-NTM/5, Y/YL-NTM/6, OU Site and R(E) Site

4.9.1 A potential private residential development has been proposed under planning application no. Y/YL-NTM/5. Based on latest information submitted to Town Planning Board in July 2024, it is understood that this planning application is now under review. For conservation approach, the proposed development parameters (i.e. 1980 units of flats and an average flat size of 57m^2) is adopted for this assessment. With reference to the standard traffic generation and attraction rates for high-density / R(A) private housing as given in the Annex C of Transport Planning and Design Manual (TPDM) Volume 1 Chapter 3, a two-way traffic generation / attraction of about 226 pcu/hr and 130 pcu/hr is estimated for AM and PM peak period respectively.

4.9.2 A potential private residential development has been proposed under planning application no. Y/YL-NTM/6 with 1,990 units of flats and an average flat size of 45m^2. With reference to the standard traffic generation and attraction rates for high-density / R(A) private housing as given in the Annex C of Transport Planning and Design Manual (TPDM) Volume 1 Chapter 3, a two-way traffic generation / attraction for both potential developments of about 150 pcu/hr and 130 pcu/hr is estimated for AM and PM peak period respectively.

4.9.3 The additional traffic has been added into the 2034 design flow (with both proposed OU and R(E) developments). Operational performances of the critical junctions are reassessed according to the revised traffic forecast. The results are summarized in Error! R eference source not found..

(7) Planned Junction Layout (refer to **Figure 4.7**)
(8) Proposed Junction Layout (refer to **Figure 4.16)**.
(9) Junction improvement scheme shown in **Figure 4.17**

4.9.4 As shown in **Table 4.14**, with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions would be able to handle the future traffic demand under Sensitivity Test Scenario.

5 SUMMARY AND CONCLUSION

5.1 Summary

5.1.1 The Application Site is located to the south of Wing Kei Tsuen, to the east of Pok Wai South Road and Kam Tin River and to the west of Castle Peak Road – Tam Mi. The Application Site currently falls within the "Industrial (Group D)" ("I(D)"), "Open Storage" ("OS") and "Road" zones on the Approved Nam Sang Wai Outline Zoning Plan (OZP) No. S/YL-NSW/8.

5.1.2 The Applicant proposes to rezone from "I(D)","OS" and "Road" zones to "Residential (Group E)" ("R(E)") zone for comprehensive development. The northern part of the Application Site is for residential development (hereafter referred as "Proposed R(E) Site Development") with domestic plot ratio of not more than 2.5 and 3,115 flats (with average flat size of 37.2m^2). The Applicant also proposes a Reserved School Site and a Relocated Soy Sauce Factory Portion at the southern part of the Application Site.

5.1.3 It is noted that there is another planning application for rezoning the "Other Specified Uses (Comprehensive Development to include Wetland Restoration Area)" ("OU(CDWRA)") zone to "OU(CDWRA)1" zone in support of a comprehensive development (hereafter referred as "Proposed OU(CDWRA)1 Site Development") with domestic plot ratio of not more than 2.2 and 6,825 flats (with average flat size of 37.5m^2) and is submitted under separate submission.

5.1.4 AECOM was commissioned by the Applicant to prepare a Traffic Impact Assessment (TIA) report in support of the Section 12A Application for the Proposed R(E) Site Development.

Development Access

5.1.5 To enhance the road capacity, it is proposed to widen the existing Castle Peak Road – Tam Mi to a 10.3m wide single carriageway as shown in **Figure 2.2**. 2 vehicular access (one priority junction and one roundabout) would be provided at Castle Peak Road – Tam Mi for the residential development, Covered Transport Lay-by, Reserved School Site and existing temporary structure as illustrated in **Figure 2.2**. The proposed layouts for the two vehicular accesses are shown in **Figure 2.3** and **Figure 2.4.** For the relocated Soy Sauce Factory, the vehicular access would be maintained at Castle Peak Road – Tam Mi. As shown in **Figure 2.4**, a 4-arm roundabout was proposed at the junction between Castle Peak Road – Tam Mi / Vehicular Access of R(E) Site – Residential Portion, Covered Transport Lay-by / Unnamed Road underneath San Tin Highway.

5.1.6 For Information, under separate submission for Proposed OU(CDWRA)1 Site Development, 2 vehicular accesses (one roundabout and one priority junction) are also proposed at Castle Peak Road – Tam Mi to serve residential development and the GIC facilities respectively, as illustrated in **Figure 2.2**. The proposed layouts for the two vehicular accesses are shown in **Figure 2.6** and **Figure 2.7** for reference**.**

Internal Transport Facilities

5.1.7 The parking and loading/unloading facilities of the Proposed R(E) Site Development will be provided in accordance with the requirements as stipulated in the latest Hong Kong Planning Standards and Guidelines (HKPSG) to cater for the transport demand, as summarised in **Table 2.3**.

Transport Facilities

5.1.8 In order to cater for the potential demand of public transport services arising from both the Proposed R(E) Site Development and adjacent OU(CDWRA)1 Site Development, a Covered Transport Lay-by with 5 bus bays, 2 General Lay-bys is proposed within the Proposed Development. Subject to the future planning of public transport services, the provision of Covered Transport Lay-by will allow adequate hardware facility to serve the future public transport demand generated by the proposed development.

Traffic Impact

5.1.9 In order to review the existing traffic condition, traffic count surveys were conducted at the following 11 identified critical junctions to investigate the traffic condition during commuting peak hours. At present, all the critical junctions are operating within capacity.

- Castle Peak Road - Tam Mi / Unnamed Road underneath San Tin Highway (J4)
- San Tam Road / Unnamed Road underneath San Tin Highway (J6)
- J/O Castle Peak Road – Tam Mi / San Tam Road (J7)
- J/O Castle Peak Road – Tam Mi / Unnamed Access Road to Cheung Chun San Tsuen (J8)
- J/O Castle Peak Road – Tam Mi / Nam Sang Wai Road (J9)
- Au Tau Interchange (J10)
- Pok Oi Interchange (J11)
- J/O Kam Tin Road / Tsing Long Highway Slip Road (J12)
- J/O Kam Tin Road / Kam Tin Bypass / Kam Ho Road (J13)
- Fairview Park Interchange (J14)
- J/O Castle Peak Road – Tam Mi / Kam Pok Road East (J15)

5.1.10 The Proposed Development will result in a difference of 2-way traffic, with an increase of 89 pcu/hr and a decrease of 207 pcu/hr during the commuting AM and PM peak.

5.1.11 The Proposed Development is scheduled for completion in 2031 tentatively. Traffic forecast for design year 2034 was produced to assess the traffic impact arising from Proposed Development. The results of junction capacity assessments revealed that junctions except J10 and J14 would be able to handle the future traffic demand with all planned improvement works implemented.

5.1.12 As mentioned in **Section 4.3.1**, planned improvement measures were proposed to Fairview Park Interchange (J14) under Sha Po Public Housing Development. Additional junction improvement proposal (**Figure 4.16**) to widen the approaching arms at Fairview Park Interchange (J14) is recommended to increase junction capacity. The performance of J14 would be improved and operating within capacity upon completion of the proposed improvement works.

5.1.13 The road link assessment results in **Table 4.6** indicated that all the above road links are expected to operate within capacity except San Tin Highway (L14) and Tai Lam Tunnel (L15). With opening of future Route 11, it was anticipated that the traffic condition of both San Tin Highway and Tai Lam Tunnel could be significantly improved. Between the year 2031 (completion year of the development) and the opening year of Route 11, the V/C ratio of both San Tin Highway and Tai Lam Tunnel would reach 1.05 and 1.17 respectively, meaning that the traffic speed would be reduced, but would still be manageable with V/C ratio under 1.2.

Cumulative Traffic Impact with Proposed Developments at OU and R(E) Site

5.1.14 A sensitivity test has been carried out for the scenario with the proposed schemes of both Proposed R(E) Site Development and Proposed OU(CDWRA) Site Development. The junction assessment results reveal that with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions (except J15) would be able to handle the future traffic demand under Sensitivity Test Scenario.

5.1.15 A junction improvement proposal to Castle Peak Road – Tam Mi / Kam Pok Road East (J15) is recommended to enhance the junction capacity. Split phases control are proposed at Castle Peak Road – Tam Mi (southbound) and Kam Pok Road East. The proposed method of control is shown in **Figure 4.17.**

Sensitivity Test (I) - With Proposed Developments at OU Site and R(E) Site but deferred of Sha Po Public Housing Site Development Schedule

5.1.16 A sensitivity analysis has been carried out to assess the traffic condition for the scenario without the aforementioned Sha Po public housing development and the corresponding junction improvements. With similar methodology adopted as discussed in the above section, 2034 traffic forecast for this sensitivity test is derived. Operational performances of the critical junctions are reassessed according to the revised traffic forecast and revealed that all the assessed junctions (except Castle Peak Road – Tam Mi / San Tam Road (J7) and Au Tau Interchange (J10)) would be able to handle the future traffic demand with all planned improvement works implemented timely.

Sensitivity Test (II) - With Potential Developments Under Planning Application no. Y/YL/MP-6, Y/YL/MP-7, Y/YL/MP-8, OU Site and R(E) Site

5.1.17 An additional sensitivity test was carried to assess the traffic impact induced by the potential private residential development proposed under planning application no. Y/YL/MP-6, Y/YL/MP-7 and Y/YL/MP-8, which is situated in the vicinity of the subject development. The junction assessment results reveal that with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions would be able to handle the future traffic demand under Sensitivity Test Scenario.

Sensitivity Test (III) - With Potential Developments Under Planning Application no. Y/YL-NTM/5, Y/YL-NTM/6, OU Site and R(E) Site

5.1.18 An additional sensitivity test was carried to assess the traffic impact induced by the potential private residential development proposed under planning application no. Y/YL-NTM/5 and Y/YL-NTM/6, which is situated in the vicinity of the subject development. The junction assessment results reveal that with all the planned/ proposed junction improvement schemes implemented timely, all the assessed junctions would be able to handle the future traffic demand under Sensitivity Test Scenario.

5.2 Conclusion

5.2.1 In light of the findings of this TIA, it is concluded that there is no insurmountable traffic impact imposed onto the local road network due to the Proposed Development. With the proposed mitigation measures in place, the Proposed Development is technically feasible in traffic terms.

PROPOSED OU(CDWRA1) SITE DEVELOPMENT
(FOR REFERENCE ONLY, UNDER SEPARTE SUBMISSION)

PROPOSED RE SITE DEVELOPMENT

RESERVED SCHOOL SITE

RELOCATED SOY SAUCE FACTORY

VEHICULAR ACCESS OF OU(CDWRA)1 SITE - GIC PORTION

VEHICULAR ACCESS OF OU(CDWRA)1 SITE - RESIDENTIAL PORTION

ACCESS ROAD TO BE HANDED OVER TO HYD FOR FUTURE MAINTENCE, SUBJECT TO DEPARTMENTAL COMMENTS

CENTRAL DIVIDER TO BE PROVIDED BETWEEN J4 AND J5

VEHICULAR ACCESS OF R(E) SITE - RESIDENTIAL PORTION & COVERED TRANSPORT LAY-BY

MIN 2M FOOTPATH TO BE PROVIDED TO FACILITATE THE PEDESTRIAN COMING FROM SHA PO SITE

VEHICULAR ACCESS OF R(E) SITE - RESERVED SCHOOL SITE & EXISTING TEMPORARY STRUCTURE

VEHICULAR ACCESS OF R(E) SITE - RELOCATED SOY SAUCE FACTORY

PROPOSED RAILWAY STATION AT AU TAU

Remarks: The alignment of the proposed cycle track and subway are for indicative purpose only. It will be subject to detailed design and engineering review at subsequent stages as the development site boundaries and interfaces between the residential portion, relocated soy sauce factory as well as the reserved school site will be further review upon approval of the subject rezoning application.

1. INTRODUCTION

1.1 Background

1.1.1 The Application Site currently falls within the "Industrial (Group D) ("I(D)"), "Open Storage" ("OS") and "Road" zones in Yuen Long. The Applicant proposed to rezone from "I(D)", "OS" and "Road" zones to "Residential (Group E)" ("R(E)") zone in support of a comprehensive development, reserved school site and relocated soy sauce factory (name "R(E)" Site).

1.1.2 There is another planning application for rezoning the "Other Specified Uses (Comprehensive Development to Include Wetland Restoration Area)" zone ("OU(CDWRA)") to "OU(CDWRA)1" zone for comprehensive development to the north of the Application Site and is submitted under separate submission (name "OU(CDWRA)1 Site").

1.1.3 Both the proposed developments at the R(E) Site and OU(CDWRA)1 Site are tentatively completed at the same time so that both developments are considered together for planning of the infrastructure.

1.1.4 Ramboll Hong Kong Limited is commissioned by the Applicant to prepare the Environmental Assessment based on the MLP. Potential environmental noise, air quality, water quality impacts and waste implication have been discussed in this context.

1.2 The Application Site and Its Environs

1.2.1 The Application Site of about 81,550 m^2 currently zoned as "I(D)" (currently occupied by a soy sauce factory), "OS" (currently occupied for open storage yard) and area shown as "Road" under the Approved Nam Sang Wai Outline Zoning Plan (No. S/YL-NSW/8).

1.2.2 The Application Site is bounded by Caste Peak Road – Tam Mi section, San Tin Highway, Tsing Long Highway to the east and Pok Wai South Road to the west. To the immediate west is an existing meander zoned "Open Space" ("O"). OU(CDWRA)1 Site is to the immediate north.

1.2.3 The northern portion of the Application Site is currently occupied by a soy sauce factory whereas the southern portion for open storage purpose with containers, trucks and some temporary structures such as shelter and container office. It is noted that the existing soy sauce factory onsite will be relocated to the southern side of the Application Site in future.

1.2.4 The surrounding area to the west is mainly ponds, river and meander. To the further north (north of OU(CDWRA)1 Site) situates some village type developments and open storage yard. The area to the east separated by heavy trafficked road includes Mo Fan Heung and Fung Kat Heung (with factory and open storage uses and some scattered village houses), Sha Po Sewage Pumping Station, Sha Po Tsuen and new residential development (Park Yoho).

1.2.5 **Figure 1.1** shows the location of the Application Site and its environment.

1.3 Proposed Scheme

1.3.1 The proposed development comprises 3 portions: (1) residential portion on northern side including 11 numbers (T1 to T12, T4 omitted) of residential towers (15 to 29 storeys) and associated facilities (e.g. clubhouses, carpark), a commercial podium and a covered transport lay-by; (2) a reserved school site for primary school located at the middle and nearby road carriageway on east side to enable access; and (3) the soy

sauce factory to be relocated from north to south side. There are altogether 3115 residential flats provided. The clubhouse and commercial uses are central air conditioned and will not rely on openable window for ventilation. Regarding the reserved school site, the applicant will be responsible for site formation and hand over to relevant government department for design and construction. For assessment purpose, a standard primary school layout has been adopted. For the relocated soy sauce factory, the Applicant will be responsible for construction as well.

1.3.2 Since the major noise source is identified to be road traffic along carriageways to the east, the master layout plan is designed so that the major sensitive façade of residential towers would have prescribed ventilation window that are north/south facing. For towers close to the carriageway, self-protecting building design will be adopted to avoid any ventilation opening of habitable room facing or with large view angle to carriageways which will be discussed in later section.

1.3.3 Another proposed development at OU(CDWRA)1 Site will consist of residential and GIC uses so that no major environmental impact due to operation of the proposed development at OU(CDWRA)1 Site is expected.

1.3.4 Both the Proposed Developments at the Application Site (R(E) Site) and OU(CDWRA)1 Site are tentatively completed for occupation by 2031.

1.3.5 The indicative Master Layout Plan (MLP) and Section Plan of the Proposed Scheme are shown in **Appendix 1.1**.

1.4 Appraisal of Environmental Impacts

Road Traffic Noise Impact

1.4.1 The major road traffic noise source with respect to the Application Site is arising from road carriageways to the east. Due to proximity to these carriageways and heavy traffic flow, road traffic noise impact assessment has been conducted to address the potential noise impact that would be generated from the road traffic with necessary noise mitigation measures proposed (detailed in **Section 2**).

Industrial / Fixed Noise Impact

1.4.2 Site survey was conducted on 23 & 25 October 2021 and 07 November 2023 to identify any environmental nuisance and focus on area within 300m from the Application Site.

1.4.3 There is an area for vehicle repair use to the northeast of the Application Site. There are also a number of temporary structures (mainly for storage purpose) and open storage use among Mo Fan Heung to the east on opposite side of road carriageways over 100m apart. The business is related to open parking of container truck, and other heavy trucks, open storage of containers, construction materials, etc. No active manufacturing premises and operations can be observed onsite. In addition, it is observed that there is a garage situated inside Mo Fan Heung, which involves using hand-held pneumatic tools. Although the separation distance between the garage and the Proposed Development is far, such garage is included in industrial noise impact assessment in later section.

1.4.4 It is also understood that Northern Link (NOL) is proposed at the opposite side of San Tin Highway (Approved EIA Report No.: AEIAR-259/2024). The proposed Au Tau Station is situated within the 300m assessment area with a number of potential fixed noise sources. The potential industrial noise impact has been addressed in this context (detailed in **Section 3**).

1.4.5 The Proposed Development (other than the relocated soy sauce factory) is not environmental polluting in nature. On the other hand, the covered transport lay-by will be decked over to minimise noise nuisance to the proposed development during its

operation. Potentially noisy equipment will likely be provided onsite such as AC system for central air conditioned area (e.g. clubhouse), mechanical ventilation for car park and covered transport lay-by, etc. As this is in early planning stage of the project, there is lack of detail such as type of equipment, location, orientation, etc. Nevertheless, the requirement to meet HKPSG fixed noise standard (as aforementioned) is well noted and will be followed. Potential impact arising from future operation of the relocated soy sauce factory has been discussed in this context.

Industrial and Vehicular Emission Impact

1.4.6 Site survey was conducted to identity any environmental nuisance and focus on area within 200m from the Application Site (see **Figure 1.2**). The potential industrial and vehicular emission impact has been addressed in **Section 3**. Covered transport lay-bys will be designed to have exhaust louver facing road and away from other proposed air sensitive uses within the Application Site. Potential impact arising from future operation of the relocated soy sauce factory has been discussed in this context.

Railway Noise Impact

1.4.7 There is no existing railway system within 300m from the Application Site (see **Figure 1.2**). Besides, it is understood that the proposed NOL is situated within the 300m assessment area but the proposed alignment would be located underground in the vicinity and isolated from the proposed development. Therefore, railway noise impact on the Proposed Development is unlikely a concern.

Water Quality Impact

1.4.8 There are waterbodies identified to the west of the Application Site including meander, Kam Tin River and ponds further apart (see **Figure 1.3**). Wastewater from the relocated soy sauce factory will be treated onsite before conveying to the Nam Sang Wai Sewage Pumping Station (NSWSPS). Future wastewater generation of new development (other than the relocated soy sauce factory) will be discharged to public sewerage system whereas surface runoff will be collected by onsite drainage system with facilities such as sand trap/oil interceptor to properly screen/filter surface runoff before discharge to public drainage system. The design of the drainage system will make reference to the ProPECC PN 1/23 "Drainage Plans Subject to Comment by the Environmental Protection Department". For example, drainage outlets provided in open areas and in covered areas are respectively connected/discharged to stormwater drains and foul sewers. Silt removal facilities should be provided where necessary. A separate drainage system that connects to foul sewers should be provided to collect wastewater from basements, subways and similar area. Swimming pool main drain, footbath main drain and make-up tank drain should be connected to stormwater drains while filtration plant backwash should be discharged to foul sewers. The aforementioned connection/discharge will be implemented before operation of the proposed development. There will not be any wastewater or untreated surface runoff discharge or any increased pollution load to water sensitive receivers nearby during its operation. Gravity sewer would be constructed to connect the Proposed Development to Nam San Wai Sewage Pumping Station. The wastewater from the relocated soy sauce factory will be treated by new onsite wastewater treatment plant (WWTP) before discharge to public sewerage system to ensure that relevant standards as stipulated under Technical Memorandum on Standards for Effluents Discharged into Drainage and Sewerage Systems, Inland and Coastal Waters (TM-DSS) can be complied with. Details please refer to the separate DIA and SIA Reports under this planning application. No insurmountable water quality impact is anticipated during its operation.

Land Contamination

1.4.9 The northern portion of the Application Site is currently occupied by a soy sauce factory since 1967. There are chimney stacks and fuel burning onsite. The manufacturing process of soy itself does not suggest any potential contamination problem. Storage of fuel or any other material that may lead to contamination problem will be subject to further investigation in later stage. Historic land uses and aerial photos discussion are detailed in **Section 6**.

1.4.10 The southern portion of the Application Site is occupied for open storage purpose with temporary structure such as shelter and container office. Compressed gas, construction tools, abandoned wood, generators, oil stains were observed onsite. It is therefore considered that there is potential land contamination problem. However, as the open storage site is still in operation, most areas are already occupied and covered. A more detailed review will be provided in later stage for substantiation.

1.4.11 In case suspected land contamination is found, the relevant requirement to conduct investigation and remediation work (if necessary) will be included in future tender and necessary submissions such as contamination assessment plan/report, remediation action plan and remediation report (if necessary) will be submitted for approval before construction work.

Construction Phase Environmental Impact

1.4.12 The major air quality impact during construction should be fugitive dust impact in relation to dusty activity and emission from dusty materials while there are other emissions as well such as SO_2/NO_2 due to use of diesel-powered equipment. Best management practice and practical mitigation measures will be adopted where appropriate.

1.4.13 Construction noise will be controlled with reference to relevant technical memorandum. ProPECC PN 1/24 on minimizing noise from construction activities will be observed and followed.

1.4.14 As for water quality aspect, during construction of the Proposed Development, water pollution is likely due to sediments, construction runoff and drainage, sewage effluent and liquid spillage if not mitigated. Best management practice will be adopted. No sewage effluent discharge will be allowed. ProPECC PN2/23 on Construction Site Drainage will be observed and followed.

1.4.15 Waste generation during construction will be sorted and handled in compliance with the Waste Disposal Ordinance and regulations.

1.4.16 With adequate mitigation measures incorporated during construction of the project, no significant construction phase environmental impact is anticipated.

1.4.17 Discussion on construction phase environmental impact is included in **Section 6**.

1.5 Organization of this Report

1.5.1 Based on the discussions above, it is considered that both industrial noise/emission, vehicular emission, railway noise are unlikely concerns given the absence of industrial emission source within 200m from the Application Site, insignificant fixed noise source, adequate separation from road carriageways and absence of railway system within 300m from the Application Site. Covered transport lay-bys will be designed to have exhaust louver facing road and away from other proposed air sensitive uses within the Application Site.

1.5.2 Therefore, road traffic noise, industrial noise and environmental impact arising from future operation of the relocated soy sauce factory (e.g. odour, fixed noise) are of major concern with respect to the Application Site. In addition, construction phase environmental impact will be more thoroughly discussed in this report.

1.5.3 The organization of remaining section of this report is:

- Section 2 is a road traffic noise impact assessment;
- Section 3 is an industrial noise impact assessment;
- Section 4 is an air quality impact assessment;
- Section 5 includes discussion of environmental mitigation measures for the relocated soy sauce factory within the Application Site;
- Section 6 includes discussion of construction phase air quality, noise, water quality and waste management issues; and
- Section 7 is a concluding summary.

2. TRAFFIC NOISE IMPACT ASSESSMENT

2.1 Introduction

2.1.1 In this assessment, potential noise impact arising from nearby existing and future road carriageways on the proposed residential development and reserved school site has been assessed using mathematical modelling. While the Applicant is responsible for site formation work of the reserved school site only, a standard primary school layout is adopted for the assessment purpose. Practicable environmental mitigation measures have been recommended, where necessary. It is noted that the scheme adopted in this rezoning application is indicative only and subject to future refinement. The assessment aims to demonstrate the feasibility to meet relevant assessment standards. It is anticipated that the traffic noise impact assessment will be updated with respect to future revision of the scheme.

2.2 Assessment Criteria

2.2.1 Regarding the proposed development, only the residential dwellings and reserved school site will have habitable room that rely on openable window for ventilation purpose. Other uses such as clubhouse, commercial use, etc. are either non-sensitive in nature or not rely on openable window for ventilation.

2.2.2 Noise standards are recommended in the HKPSG for planning against noise impact. According to the guidelines, the maximum noise level from road traffic, measured in terms of L_{10} (1-hr) is recommended to be 70dB(A) at typical façades of new dwellings; 65dB(A) for primary school.

2.3 Assessment Methodology

2.3.1 The methodology involved the prediction of future noise impacts on Noise Sensitive Receivers (NSRs) arising from traffic flows on existing and future road carriageways situated in the vicinity of the Application Site.

2.3.2 The U.K. Department of Transport's procedure "Calculation of Road Traffic Noise" was used to predict the hourly L_{10} noise levels generated from road traffic at selected representative NSRs. The predicted noise levels were then compared with the relevant HKPSG noise standards. Noise mitigation measures are recommended to attenuate the noise impact from road traffic.

2.3.3 The tentative completion year of the proposed development is 2031. In addition, it is noted that another proposed development to the immediate north of the Application Site (i.e. at OU(CDWRA)1 Site) with same tentative completion year has been proposed and its planning submission has been separately submitted at the same time. Both proposed developments will be in place in 2031. For the purpose of assessment, the proposed scheme to the north of the Application Site (i.e. at OU(CDWRA)1 Site) has also been incorporated into the model.

2.3.4 Based on the completion year of the development, peak hourly traffic forecast for the year 2046 on the road carriageways situated in the vicinity of the Application Site provided by the Project Traffic Consultant (AECOM), which is considered representative of the worst case situation within 15 years from the completion of the proposed development. The traffic forecast has accounted both proposed developments (at the Application Site and to its north). The traffic flows and percentage of heavy vehicles of the set of data are shown in **Appendix 2.1**. Endorsement of the methodology adopted for the traffic forecast data from Transport Department and confirmation letter from the Project Traffic Consultant are provided in **Appendix 2.1**.

2.4 Building Design to Reduce Noise Impact

2.4.1 According to the traffic forecast, Tsing Long Highway, Castle Peak Road – Tam Mi and San Tam Road would be the dominant traffic noise sources. Therefore, noise-mitigated design would be adopted in the first hand in the Development Scheme as described below and shown in **Figure 2.3**.

Building Orientation

Major noise sources are aligned all along eastern site boundary. If the major façade of building block is east/west facing, about half of the dwelling would be subject to significant noise impact. In the development scheme, the building blocks are oriented so that major façade is north/south facing. While there will still be view to the major noise sources, the impact will be reduced.

It is noted that in order to allow wind penetration (e.g. annual prevailing East wind), sufficient building separation should be retained between blocks so that a wall design to shield up all noise from east side is not practicably possible and would not be in compliance with Sustainable Building Design Guidelines under APP-152.

Similarly, for the primary school development, the major sensitive façade (with windows of classrooms) is oriented (facing south) to avoid directly facing road.

Self-Protecting Building Design

Arranging non-noise sensitive facade of a building instead of window façade of living room and bedroom at east end of the block to face the dominant traffic noise sources to minimise the noise impact. The non-noise sensitive uses could also act as a noise shielding structure to protect the residents at the back.

- All prescribed window openings of towers nearer to dominant traffic noise sources on east side are arranged to avoid facing the dominant traffic noise source directly. On the other hand, non-noise sensitive uses (e.g. bathrooms, staircase and corridor), blank wall, maintenance balcony with auto door closing system and fixed glazing (with or without maintenance window) which are not for prescribed ventilation purpose (to be discussed below) will be arranged for the façade directly facing the dominant traffic noise sources at first layer of residential towers nearest to road carriageway (e.g. Tower 1 and 6).
- Blocks with extended wing will be provided at the first layer residential towers (e.g. Tower 1 and 6) to maximize the screening effect to the residential units at the back.

Door with Auto-Closing Mechanism

To shield road traffic noise, some door openings directly facing the dominant traffic noise sources will be designed with auto-closing mechanism. These door openings will not be relied on for ventilation and will not be deployed as prescribed opening for fulfilling the ventilation requirements under (B(P)R). The door with auto-closing mechanism would remain closed except accessing to the balcony/ utility platform.

Fixed Glazing (with or without Maintenance Window)

To shield road traffic noise, window of noise sensitive uses (e.g. bedroom and living room) directly facing the dominant traffic noise sources will be designed as fixed glazing (with or without maintenance window) which is not for ventilation purpose. The fixed glazing with maintenance window will be equipped with a removable handle or key lock system to ensure the maintenance window remains locked except for cleaning and maintenance purposes.

2.5 Noise Sensitive Receivers

2.5.1 According to the Development Scheme, the Application Site includes the residential buildings and future primary school which would rely on openable window for ventilation and are considered noise sensitive according to the HKPSG.

2.5.2 As mentioned in **Section 2.4**, primary school will be oriented so that the façade adjacent to the dominant traffic noise source would not have any openable window of habitable area. Only southern and western façades of the primary school would be considered as noise sensitive façade (with prescribed ventilation window) in this assessment.

2.5.3 All NSRs will be provided with prescribed ventilation windows for natural ventilation complying with the Building (Planning) Regulations, Cap 123. Thus, assessment points are assigned to these prescribed ventilation windows of the residential units.

2.5.4 The locations of representative noise sensitive receivers are shown in **Figure 2.1.** The assessment points have been taken to be situated at 1.2m above floor slabs and at 1m away from the external façade.

2.6 Predicted Road Traffic Noise Level under Base Case Scenario

2.6.1 Under base case scenario, the building design to reduce noise impact is accounted. No additional noise mitigation measures are assumed other than the disposition and orientation with blank wall, façade of non-noise sensitive uses and fixed glazing (may be provided with maintenance window which is not for ventilation purpose) as described in **Section 2.4**.

Primary School

2.6.2 Based on the noise assessment results, the noise levels of the representative NSRs range from 59dB(A) to 81dB(A) (i.e. maximum exceedance is 16dB(A), see **Appendix 2.2**).

2.6.3 Scenario for AM peak flow is considered to be the worse case scenario. Noise mitigation measures are recommended based on the AM scenario to attenuate the road traffic noise impact.

Residential Units

2.6.4 As this assessment serves to support the planning application instead of a detailed noise impact assessment with respect to a detailed design, representative NSRs are distributed among different residential towers to obtain the general noise levels of individual towers. The locations of representative NSRs are shown in **Figure 2.1**. Detailed assessment would be further conducted for residential towers with noise level exceeding the noise standard of 70dB(A).

2.6.5 Based on the noise assessment results, the maximum noise levels of Tower 1 to Tower 9 exceeded the noise standard of 70dB(A). The NSRs with noise exceedance are summarised in **Table 2.1** and indicated in **Figure 2.1** Detailed are presented in **Appendix 2.3**. Same as the primary school portion, scenario for AM peak flow is considered to be the worse case scenario. Noise mitigation measures are recommended based on the AM scenario to attenuate the road traffic noise impact.

Table 2.1 Summary Table of Representative NSRs at Residential Towers

Tower Cluster	NSRs ID		Tower	Floors	No. of Floors	Max. Noise Level of Tower Cluster, dB(A)	Exceedance at Specific Tower (*)
	From	To					
Residential Units							
T1-T2	S1_T1-T2-1	S1_T1-T2-7	T2	G/F to 32/F	29	78	Y
	S1_T1-T2-8	S1_T1-T2-13	T1	G/F to 32/F	29		Y
T3–T5	S1_T3–T5-1	S1_T3–T5-9	T5	G/F to 21/F	19	75	Y
	S1_T3–T5-10	S1_T3–T5-15	T3	G/F to 27/F	24		Y
T6-T7	S1_T7-T8-1	S1_T7-T8-8	T8	G/F to 32/F	29	77	Y
	S1_T7-T8-9	S1_T7-T8-14	T7	G/F to 32/F	29		Y
T8-T9	S1_T8-T9-1	S1_T8-T9-5	T8	G/F to 32/F	29	75	Y
	S1_T8-T9-6	S1_T8-T9-12	T9	G/F to 32/F	29		Y
T10-T11	S1_T10-T11-1	S1_T10-T11-6	T11	G/F to 17/F	15	69	N
	S1_T10-T11-7	S1_T10-T11-16	T10	G/F to 21/F	19		N
T12	S1_T12-1	S1_T12-10	T12	G/F to 17/F	15	64	N

Remark – 4/F, 13/F, 14/F, 24/F are omitted.

Note (*) – Tower with Noise Exceedance is referred to any NAP at specific tower or immediately adjacent to specific tower as indicated in Figure 2.1 are found to exceed the 70dB(A) noise level.

Detailed Assessment Points – Residential Units

2.6.6 With reference to the **Table 2.1**, exceedances were observed at Tower 1 to Tower 9. Therefore, detailed noise assessment with assessment points assigned to prescribed ventilation window of each habitable room is further conducted for designing noise mitigation measures for corresponding units. The locations of the detailed NSRs are shown in **Figure 2.2**.

2.6.7 Based on the noise assessment results as shown in **Table 2.2**, the noise exceedances range from 2dB(A) to 8dB(A) under AM peak scenario. Detailed results are presented in **Appendix 2.3.** The proposed mitigation measures would be further discussed in **Section 2.7**.

Table 2.2 Summary Table of Detailed NSRs at Noise Exceedance Residential Towers

Tower	Floors	No. of Floors	Max. Noise Levels, dB(A)	Noise Exceedance, dB(A)
T1	G/F to 32/F	29	78	8
T2	GF to 32/F	29	76	6
T3	G/F to 27/F	24	75	5
T5	G/F to 21/F	19	75	5
T6	G/F to 32/F	29	77	7
T7	G/F to 32/F	29	75	5
T8	G/F to 32/F	29	72	2
T9	G/F to 32/F	29	75	5

2.7 Proposed Noise Mitigation Measures under Mitigated Scenario

Vertical Acoustic Fin

2.7.1 In order to further reduce the noise impact, a 1.5m long vertical architectural fin is proposed. Sound absorptive material (SAM) is proposed at the surface and tip of all vertical fins to minimise noise reflection or reverberation. Noise reduction due to use of vertical fin is determined based on approach of CRTN but capped to not more than 3dB(A).

Acoustic Window (Baffle Type) / Acoustic Door (Baffle Type)

2.7.2 An acoustic window comprising outer window system and inner sliding panel (referred as baffle type acoustic window) is designed and applied in precedent cases for both public and private housing developments. The setting of the system is that while the outer window is opened, the sliding panel should be shifted to behind the outer opening. The outer opening and inner opening (aside the sliding panel) are then on the opposite sides so that noise outdoors cannot penetrate directly into indoor area while air can pass through the gap between outer and inner glass pane so that natural ventilation is possible.

Reference Project 1 – Residential Development at North Point Inland Lot No. 9027

2.7.3 Acoustic window/door (window/door) opening with sliding panel behind has been adopted in North Point Inland Lot No. 9027 project (also by the Applicant of this application). The use of windows/doors with sliding panel behind will enable natural ventilation through the gap between the outer façade and inner sliding panel on one hand and prevent most noise from penetrating to indoor environment on the other hand. On-site field test has been conducted for verifying the performance of the door with sliding panel (without micro-perforated absorber (MPA)) and windows with sliding panel behind (with and without MPA). According to the test result, 1 window opening with sliding panel and outer façade with overlap of 253mm and gap of 100mm can achieve sound attenuation of 4.6dB(A) for the case without MPA and 6.9dB(A) for the case with MPA applied in front of the sliding panel for a 6.8m2 bedroom. 2 windows opening with sliding panel and outer façade with overlap of 255mm/268mm and gap of 100mm can achieve sound attenuation of 5.1dB(A) for the case without MPA and 6.7dB(A) for the case with MPA applied in front of the sliding panel for a 14.6m^2 bedroom. Door with sliding panel and outer façade with overlap of 275mm and gap of 100mm can achieve sound attenuation of 8.8dB(A) for the case without MPA in front of the sliding panel for a 38.3m^2 living room.

Reference Project 2 – King Tai Court

2.7.4 For acoustic door without MPA, other project experiences of acoustic window system (e.g. King Tai Court) indicate that the use of MPA could provide more than 1dB(A) extra reduction. As a conservative assessment approach, it is assumed that 1.0dB(A) will be additionally provided for acoustic door.

Reference Practice Note - PN 5/23 Application of Innovative Noise Mitigation Designs in Planning Private Residential Developments against Road Traffic Noise Impact

2.7.5 With reference to the captioned Practice Note (AW(BT)) issued by EPD, additional Sound Absorptive Material (SAM) of thickness ≥30mm and Noise Reduction Coefficient ≥ 0.7 at top and both side of window frame can offer an additional 1.5dB(A) reduction. SAM is recommended to be applied to the acoustic door and acoustic window in this project.

2.7.6 To summarize based on these reference projects above, the sound attenuation of acoustic window/door system of similar configuration can achieve the following sound attenuation.

Acoustic Window/ Door System	MPA applied?	SAM applied?	Overlapping length	Sound Attenuation
Acoustic Door for living room	No	No	275mm	8.8dB(A)
Acoustic Door for living room	No	Yes	275mm	8.8+1.5=10.3dB(A)
Acoustic Door for living room #	*Yes*	*Yes*	*275mm*	*8.8+1.5+1=11.3dB(A)*
Acoustic Window (1 window opening) for bedroom	Yes	No	253mm	6.9dB(A)
Acoustic Window (1 window opening) for bedroom) #	Yes	Yes	253mm	6.9+1.5=8.4dB(A)

Note (#) - measures adopted in this study

2.7.7 The sketches of acoustic window/door (baffle type) are shown in **Figure 2.4**

2.7.8 It is understood that apart from the overlapping length and gap between outer window/façade and inner sliding panel, the size of the outer opening would also affect the sound attenuation performance. In general, the smaller the outer opening, less noise can penetrate to indoor area. In addition, the outer opening usually correlates to the room size according to Building (Planning) Regulations which requires a minimum opening equivalent to 1/16 of the room size. The base case using conventional window should have the opening size meeting such requirement. In the proposed development, the outer opening is designed to be equal to or smaller than the reference cases so that the transmission loss of the acoustic window/door (baffle type) of the Proposed Scheme should be better or at least the same as the reference case. Yet, as the room size may be different, the corresponding base case transmission loss may vary so that the sound attenuation of the reference cases cannot be adopted directly. A conservative approach is adopted by adjusting the sound attenuation based on the relative room size of the proposed case and reference case. The sound attenuation is adjusted (downward only) based on the ratio of the room size of the Proposed Scheme and the reference cases in order to reflect the difference in the base case (using conventional window/door). On the other hand, in case the room size of the proposed case is larger than the reference case or opening size of the conventional window in the proposed case is larger than the reference case, no adjustment is made as a conservative approach.

2.7.9 With reference to the Project Scheme, the smallest size of the living room and bedroom is 12.3m^2 and 4.5m^2, respectively. **Appendix 2.5** shows the adjustment and claimed maximum sound attenuation with respect to the aforementioned habitable rooms.

2.7.10 It is also noted that the mitigated noise level predicted based on application of acoustic window/door is not the actual noise level at the external façade. It is the equivalent noise level at 1m from the external façade after accounting the reduction in noise levels inside the room offered by the proposed noise mitigation measures.

2.7.11 The locations of the noise mitigation measures are shown in **Figure 2.3** and **Appendix 2.6**. With implementation of the aforementioned noise mitigation measures, there is no exceedance of relevant road traffic noise standard.

2.8 Predicted Road Traffic Noise Level under Mitigated Scenario

2.8.1 With the proposed mitigation measures in place, the noise impacts on residential dwelling are attenuated. According to the result in **Appendix 2.4**, no dwelling would have the predicted noise level exceeding the HKPSG standard. Full compliance can be achieved.

2.8.2 Regarding the Primary School, the locations with exceedances would be provided with air-conditioning and window system with noise insulation equivalent or better than *Window Type III in Appendix 4.4, Chapter 9 of the HKPSG* as shown in **Figure 2.3c** to achieve a silent indoor environment as last resort.

2.9 Conclusion

2.9.1 The assessment result for residential units indicated that with the mitigation measures in place, the HKPSG traffic noise standards can be met at all NSRs of the residential dwellings. The proposed mitigation measures include orientation, self-protecting building design (coupled with Door with Auto-Closing Mechanism, Fixed Glazing (with or without Maintenance Window)), acoustic window/door (baffle type), vertical acoustic fin and fixed glazing (with or without maintenance window). The environmental feasibility from road traffic noise perspective is considered acceptable.

2.9.2 Regarding the Primary School, the locations with exceedances would be provided with air-conditioning and window system with noise insulation equivalent or better than *Window Type III in Appendix 4.4, Chapter 9 of the HKPSG* to achieve a silent indoor environment as last resort.

3. INDUSTRIAL NOISE IMPACT ASSESSMENT

3.1 Introduction

3.1.1 In this assessment, potential noise impact due to identified industrial noise sources nearby on the proposed residential development has been assessed based on standard acoustical principle. Practicable environmental mitigation measures have been recommended, where necessary.

3.2 Industrial/Fixed Noise Impact Assessment Criteria

3.2.1 Impacts of fixed noise sources on sensitive uses of the Proposed Development are controlled under the *Noise Control Ordinance* ("*NCO*"), which requires that the impacts must comply with the *Acceptable Noise Levels* ("*ANL*") laid down in Table 2 of the *Technical Memorandum for the Assessment of Noise from Places other than Domestic Premises, Public Places or Construction Sites* ("*IND-TM*").

3.2.2 In setting the *ANL*, reference has to be made to the *Area Sensitive Rating* ("*ASR*") in Table 1 of *IND-TM* reflecting the type of area where the noise sensitive receivers ("NSRs") are situated. The proposed development consists of 11 residential towers with maximum 29 storeys. Despite that the surrounding existing residential developments are low density residential use, the proposed development is not considered a rural village type development, low density residential area with isolated high-rise development or urban area. Most future noise sensitive uses of the proposed development (facing north, east and south) are expected to be directly affected by San Tin Highway with Annual Average Daily Traffic ("AADT") in excess of 30,000 (i.e. influencing factor, IF). An *ASR* of "C" is considered representative of most noise sensitive uses. On the other hand, for noise sensitive use facing west (away from IF), it is not considered affected by IF so that ASR "B" is considered representative. The respective standards for day and evening time (0700-2300) and night time (2300-0700) are:

- Leq(30min) 70 dB(A) and 60dB(A) for noise sensitive uses directly affected by IF; and
- Leq(30min) 65 dB(A) and 55dB(A) for noise sensitive uses indirectly affected or not affected by IF.

3.2.3 **Figure 3.1** presents the applicable area sensitivity rating for individual facades.

3.3 Identification of Industrial/Fixed Noise

3.3.1 Desktop survey has been conducted to identify any presence of industrial/fixed noisy facilities/activities. Onsite surveys have been conducted on 23 & 25 October 2021 and 07 November 2023 to identify any presence of industrial/fixed noisy facilities/activities and evaluate the strength. The potential industrial / fixed noise sources are listed below and shown in **Figure 3.2.** Detailed descriptions are shown in below paragraphs.

Table 3.1 Identification of Industrial Noise Sources during Site Visits

Source ID	Name	Location	Usage	Notional Distance to Site Boundary	Accounted as Fixed Noise Sources?
PFN4	No Name	Opposite to Wing Kei Tsuen	Vehicle Repair	280m	No
PFN6	潤澤汽車服務公司	Mo Fan Heung	Vehicle Repair	155m	Yes
PFN7	Sha Po Sewage Pumping Station	At San Tam Road	Pumping Station	130m	No

3.3.2 PFN4 (Vehicle Repair) is located to the north of the Site about 23m apart. According to the site visits, there is no powered equipment such as pneumatic/hydraulic powered water jet, pump, etc. The vehicle repair is immediately adjacent (about 20m) to the village houses of Wing Kei Tsuen. Given that there is not heavy or powered mechanical equipment used for the vehicle repair activities and the scale of the vehicle repair is small, adverse noise impact from PFN4 is not anticipated and thus not considered as a fixed noise source.

3.3.3 PFN6 (Vehicle Repair) is located to the east of the Site about 155m. PFN6 and the Application Site is separated by San Tin Highway. According to the site surveys, this garage opens during daytime & evening time only. No nighttime operation (2300 – 0700) was observed. The operation activities involve using vehicle lifting machines and hand-held pneumatic tools, hammering, car washing & grinding works and tyre replacement. The noise level based on findings in previous environmental assessment studies have been referenced and adopted in this assessment.

3.3.4 PFN7 (Sewage Pumping Station) is located to the southeast of the Site about 290m. The powered mechanical equipment of the pumping station is enclosed. According to the site surveys, no noticeable noise was found at the surroundings of the pumping station. Thus, PFN7 is thus not considered as a fixed noise source.

3.3.5 Other than those identified during site surveys, it is observed that the proposed Au Tau Station (AUT) under the proposed Northern Link is situated at Mo Fan Heung, opposite side of San Tin Highway. A number of potential fixed noise sources (i.e. ventilation louvre, cooling towers, AC outdoor units) have been proposed at the proposed AUT (see **Appendix 3.1**). These noise sources are included in this fixed noise impact assessment.

3.3.6 Based on the above observations, PFN6 and the proposed AUT are identified as the fixed noise source to be accounted in this assessment. Quantitative noise impact assessment has been conducted and presented in following section.

3.4 Industrial/Fixed Noise Impact Assessment Methodology

3.4.1 Assessment of noise impact arising from industrial/fixed noise sources has been based on standard acoustic principles and procedures given in the Technical Memorandum for the Assessment of Noise from Places other than Domestic Premises, Public Places or Construction Sites ("IND-TM") issued under the NCO.

3.4.2 Noise impacts due to individual noise sources are calculated and logarithmically summed at each NSR to represent the overall impacts:

$$\sum PNL_i = \sum [SWL_i + C_{distance} + C_{impulse} + C_{intermittency} + C_{tonality} + C_{barrier} + C_{facade}]$$

where

PNL_i	=	Predicted noise level, i.e. the overall sound pressure level arising from individual noise sources after various corrections
SWL_i	=	Sound power level of individual noise sources from measured noise levels / reference catalogue / relevant TM and study
$C_{distance}$	=	Correction for distance attenuation (for simplicity, only horizontal distance is considered in this study)
$C_{impulse}$	=	Correction (+3 dB(A)) for impulsive noise in IND-TM, if applicable
$C_{intermittency}$	=	Correction (+3 dB(A)) for intermittency noise in IND-TM, if applicable

$C_{tonality}$ = Correction for tonality as in IND-TM, if applicable

C_{facade} = Correction (+3 dB(A)) for façade reflection at receiver

3.4.3 As a conservative approach, barrier correction is not applied even there is no direct line of sight between NSRs and identified noise sources.

3.4.4 The SWLs for the proposed fixed noise sources under the proposed AUT are referred from the NOL EIA report (see **Appendix 3.1**).

3.4.5 No tonality, intermittency or impulsiveness generated from the fixed noise sources is expected. Thus, no correction would be adopted to the $C_{impulse}$, $C_{intermittency}$ and $C_{tonality}$.

3.5 Representative Noise Sensitive Receivers (NSRs)

3.5.1 Representative NSRs within the Subject Site have been selected to represent the noise sensitive uses of the proposed development worst affected by industrial/fixed noise in this assessment. Locations of the representative NSRs are shown in **Figure 3.3.**

3.6 Predicted Fixed Noise Level under Base Case Scenario

3.6.1 The predicted fixed noise level (Leq(30min)) under base case scenario for the Proposed Development (without any noise mitigation measures) is presented below. Detailed calculation is included in **Appendix 3.2**. According to the result, no adverse fixed noise impact is anticipated.

Table 3.2 Predicted Fixed Noise Level at Selected NSRs

NSR	Representative Building	Daytime (0700-2300)		Night-time (2300-0700)	
		Predicted Noise Level, Leq(30min)	Applicable Standard	Predicted Noise Level, Leq(30min)	Applicable Standard
NSR1	Residential Tower T6	53 dB(A)	70 dB(A)	43 dB(A)	60 dB(A)
NSR2	Residential Tower T1	53 dB(A)	70 dB(A)	43 dB(A)	60 dB(A)

3.7 Conclusion

3.7.1 The assessment result indicated that relevant standards can be met at all representative NSRs of the proposed development under Base Case Scenario (i.e. no noise mitigation measure).

4. AIR QUALITY IMPACT ASSESSMENT

4.1 Introduction

4.1.1 This section evaluates the air quality impact during operation of the project. Table 3.1 in Chapter 9 of the HKPSG has been referenced for provision of buffer separation from identified air pollution sources in the surrounding.

4.2 Industrial Emission Impact

4.2.1 Site surveys were conducted on 23 & 25 October 2021 and 07 November 2023 to identify any environmental nuisance and focus on area within 200m from the Application Site (see **Figure 1.2**).

4.2.2 Regarding the Proposed Development, the residential and school portions are not considered environmental polluting in nature. There is no chimney stack other than those for emergency use (i.e. emergency generator). The exhaust (if any) of the proposed car park shall be located away from any nearby ASRs including the air sensitive uses of the Proposed Development as far as possible. EPD's ProPECC PN2/96 on Control of Air Pollution in Car Parks will be observed and followed for the design and operation of the proposed carpark such that the air quality guidelines set out in the PN are met under all conditions.

4.2.3 It is noted that the existing soy sauce factory has been identified to generate odour nuisance, and the source of odour will mainly be the fermentation process and cooking process of soybeans. The semi-product will be put into concrete tanks and covered with transparent plastic pane during the fermentation process. As observed onsite, odour from container in open area is less significant and the existing factory is equipped with chimney stacks (the factory normally utilises Towngas and diesel would only be used occasionally) that would result in air quality impact. In addition, the existing factory has wastewater treatment plant (WWTP) and open tank for oil interceptor installed which are considered odour sources as well. It is however noted that WWTP of the relocated factory will be enclosed and equipped with odour removal system at the ventilation exhaust of the WWTP. In addition, there will be no longer any open tank for oil interceptor in the relocated factory. The potential odour emission source of the relocated factory has been identified and accounted in the assessment to be discussed in later sections. In the rezoning application, it is proposed that the existing soy sauce factory will be demolished before population intake of the Proposed Development and the relocated soy sauce factory will be constructed among southern portion of the Application Site. Since the existing soy sauce factory will be relocated to the southern side of the Application Site, opportunity would allow so that necessary environmental mitigation measures will be incorporated into the future soy sauce factory and detailed in **Section 5**.

4.2.4 Other than the soy sauce factory onsite, no chimney emission can be identified within 200m from the Application Site. Besides, Sha Po Sewage Pumping Station (SPS) is located over 130m to the east of the Application Site on the opposite side of highway. The SPS is fenced off. Louver of the SPS is found on east façade which is away from the Application Site. As observed when walking around the SPS, no odour can be detected. Similarly, no odour can be observed at the Application Site which is well apart from the SPS. There is no other fluff, odour, smoke or any other criteria pollutant emission observed at the Application Site and adjacent areas as well.

4.3 Vehicular Emission Impact

4.3.1 The Application Site is bounded by Castle Peak Road – Tam Mi, San Tin Highway, Tsing Long Highway, San Tam Road to the east and Pok Wai South Road to the west.

4.3.2 San Tin Highway, and Tsing Long Highway are considered primary distributor or equivalent according to Annual Traffic Census 2022. Thus, 20m buffer distance from San Tin Highway, San Tam Road and Tsing Long Highway should be provided.

4.3.3 Castle Peak Road – Tam Mi and San Tam Road are classified as rural road while Pok Wai South Road is classified as feeder road as confirmed by TD (see **Appendix 4.1**). It is understood that for urban area, the road classification hierarchy comprises trunk road, primary distributor, district distributor and local distributor roads. For rural area however, the classification includes trunk road, rural road, feeder road and single track access road. Rural road is generally equivalent to either local distributor or district distributor by considering its function and traffic volume. As a conservative approach, it is assumed that these roads are district distributor equivalent. Pok Wai South Road is considered equivalent to local distributor Thus, 10m buffer distance from the Castle Peak Road – Tam Mi and San Tam Road should be provided. 5m buffer distance from Pok Wai South Road should be provided.

4.3.4 **Figure 4.1** shows the separation distance provided. Tsing Long Highway and San Tam Road is far away from the Site (i.e. more than 20m). The minimum separation distances of Pok Wai South Road, San Tin Highway and Castle Peak Road – Tam Mi comply with the required buffer distance as stipulated in the HKPSG. No adverse vehicular emission impact is anticipated. All internal roads are EVA so that the buffer distance requirement is not considered applicable.

4.3.5 EPD's ProPECC PN 2/96 on Control of Air Pollution in Car Parks will be followed for the design and operation of the proposed carpark such that the air quality guidelines set out in the PN are met under all conditions. The exhaust location of the proposed car park will be designed to locate away from the existing and planned ASRs.

4.3.6 Covered transport lay-bys are proposed at the Application Site (R(E) Site). The covered transport lay-bys will be immediate to road carriageways to the east. The covered transport lay-bys will be decked over and mechanical ventilation system will be provided to extract air from the covered transport lay-bys. The exhaust of the proposed transport lay-bys shall be located away from any air-sensitive uses (not limited to the proposed development) as far as possible. In this case, the exhaust will be located on the eastern façade of the covered transport lay-bys fronting road so that it would unlikely result in any adverse air quality impact on the nearby air sensitive uses. EPD's latest released ProPECC PN1/22 on Control of Air Pollution in Semi-Confined Public Transport Interchanges will be followed for the design and operation of the proposed transport lay-by (which will be decked and provided with mechanical ventilation) such that the air quality guidelines set out in PN1/22 are met under all conditions. Adverse air quality impact due to operation of the covered transport lay-bys is not anticipated.

4.3.7 The relocated soy sauce factory would have the same scale as the existing soy sauce factory. The induced traffic is therefore considered to be similar before and after relocation. Adverse air quality impacts due to the induced traffic by the relocated soy sauce factory during operational phase is not anticipated.

4.4 Conclusion

4.4.1 As confirmed in site survey, there is no chimney identified within 200m from the Application Site except the existing soy sauce. The existing soy sauce factory would be relocated to the southern portion of the R(E) Site.

4.4.2 The relocated soy sauce factory is proposed with mechanical ventilation with deodorization units in order to minimise odour impact to the acceptable level. The details of the odour impact assessment (OIA) are provided in **Appendix 5.1**.

4.4.3 There will be no air sensitive uses, including fresh air intake of ventilation system or openable windows of residential towers, recreational uses in open space located within the buffer zones for roads and chimneys as stipulated in the HKPSG. Carpark and covered transport lay-by are proposed at the Application Site. EPD's ProPECC PN 2/96 and 1/22 will be observed and followed for the design and operation of carpark and covered transport lay-by. No adverse vehicular emission impact is anticipated.

4.4.4 With the recommended provisions, it is envisaged that the proposed development at the Application Site would not be subject to adverse air quality and odour impact. As the project is in preliminary stage, design details may be updated during scheme and system design evolvement for the relocated soy sauce factory. Updated OIA will be submitted in later stage to investigate the odour impact from the relocated soy sauce factory based on revision of design information, if any.

5. ENVIRONMENTAL MITIGATION MEASSURES FOR RELOCATED SOY SAUCE FACTORY

5.1 Introduction

5.1.1 As discussed in **Section 1**, environmental impacts from the operation of the existing soy sauce factory onsite have been identified in site survey, the major impact should be odour arising from soy manufacturing. In addition, chimney stack emissions were identified. During the survey, noise generation from soy sauce factory was considered minor and most manufacturing activities were carried out indoors.

5.1.2 In view of the proposal to relocate the soy sauce factory to southern side of the Application Site, this Section includes discussion of recommended environmental mitigation measures which will be implemented by the Applicant in order to avoid any significant impact to the existing and planned environmental sensitive uses in the surroundings.

5.2 Air Quality

Odour

5.2.1 The major air quality impact as observed should be odour emission. Chinese soy manufacturing would involve process like screening and steaming of soybeans, fermentation of soybeans (1st fermentation), 2nd fermentation of the fermented soybeans mixed with brine under sunshine for about 3 to 6 months (2nd fermentation) and the cooking and food processing of soy sauce, bean-based products and other related products. As advised by the operator, most processes excluding ageing under sunshine are carried out within the manufacturing factory. The source of odour will mainly be the fermentation process and cooking process of soybeans. In addition, odour from ventilation exhaust of the WWTP of the relocated factory has also been accounted (while the open tank for oil interceptor of existing factory will no longer be provided in the relocated factory).

5.2.2 The existing building has openable window and mechanical fan installed. There is absence of any odour removal system. While the odorous operations are carried out indoors, there is odour emission from openable window and mechanical ventilation exhaust.

5.2.3 On the other hand, rectangular concrete tanks are found in open area of the factory for 2nd fermentation. The container is covered with transparent plastic pane. Odour emission from the concrete tanks is less significant when compared to the situation when the tank is opened with soy bean loading/unloading operation.

5.2.4 In order to minimise odour impact from manufacturing process, practical and effective mitigation measures (such as mechanical ventilation with deodorization units) will be installed in the relocated factory building.

5.2.5 The location for the relocated soy sauce factory is separated from the nearest surrounding air sensitive uses by 10m to the village houses at west and more than 360m to Park Yoho and Sha Po Tsuen on southeast side. In order to assess the odour impact due to the relocated soy sauce factory, an odour impact assessment (OIA) has been conducted and provided in **Appendix 5.1**. Adequate mitigation measures have been recommended in the OIA report and are summarised below.

Proposed Mitigation Measures for the Relocated Soy Sauce Factory

- All odorous operation and facilities including wastewater treatment plant, the fermentation room, kitchen, etc. (except tanks for ageing under sunlight) will be housed indoors and provided with mechanical ventilation (window will not

be opened for ventilation to ensure that odour from within the building will be discharged through mechanical ventilation only).

- Deodorization units consisting of Electrostatic Precipitator and Nano-Confined Catalytic Oxidation (NCCO) unit with targeted 87.5% odour removal efficiency are proposed for oil and odour removal from the exhaust(s). They will be installed at location farthest away from proposed residential development which is air sensitive in nature. The exhaust will be facing away from the air sensitive uses as well to minimise the impact.
- It is also committed that the concrete tanks will be covered at all time except during collecting bean paste and not more than 3 concrete tanks will be opened at the same time.
- Commissioning test will be conducted to verify the deodorization efficiency before soy sauce factory operation. If the target odour removal efficiency could not be achieved during commissioning test, a revised odour impact assessment shall be updated to evaluate the impact. Further mitigation measures will be incorporated to demonstrate that there is no adverse odour impact on the nearby ASRs;
- Regular monitoring on odour removal efficiency during operation stage will be carried out. Odour samples shall be collected monthly at the inlet and outlet of the odour removal systems. If that the target odour removal efficiency could not be achieved is found during regular monitoring, remedial/rectification actions shall be taken until the odour removal system is resumed normal; and
- In case odour complaint is received, odour patrol will be conducted at relevant ASR(s) and the site boundary of the relocated factory. Remedial actions shall be taken for rectification if it is confirmed to be related to the operation of the soy sauce factory.

With proper implementation of mitigation measures recommended in the OIA, adverse odour impact on existing uses and planned uses is not anticipated. The cumulative odour impacts associated with planned and existing odour emission sources, identified within 500m assessment area of the site boundary of the relocated soy sauce factory on the nearby ASRs (including the existing air sensitive uses and the air sensitive uses of the Proposed Development) have been assessed and adverse odour impact would not be anticipated.

Industrial Stack Emission

5.2.6 The existing soy sauce factory would make use of Towngas or diesel for some of the manufacturing process (cooking of beans). For the relocated soy sauce factory, it would rely on electricity. There will be no chimney stack required in future and stack emission will be eliminated.

5.3 Noise

5.3.1 For the relocated soy sauce factory, most manufacturing process (except ageing of semi-product which does not involve and mechanical equipment) will be carried out indoors as the existing soy sauce factory does. Mechanical ventilation exhaust will be located on southern façade of the building so that it is away and has no direct line of sight with the proposed noise sensitive uses in the Application Site and to the north of the factory. The nearest existing noise sensitive uses (village houses to the immediate west) is separated from the factory site by 10m.

5.3.2 As this is in early planning stage of the project, there is lack of further detail such as full list of equipment, location, etc. Nevertheless, the requirement to meet HKPSG

standard (Acceptable Noise Level – 5 dB(A) or prevailing background whichever is lower) for both existing and future noise sensitive uses is well noted and will be specified in future document for detailed design and tender so that engineers and contractors need to strictly follow.

5.4 Water Quality Impact

5.4.1 Internal drainage system will be constructed to collect surface runoff. All surface runoff collected will be discharged to public drainage system. A drainage impact assessment is prepared separately with the drainage connection proposal included.

5.4.2 All wastewater of development (other than the relocated soy sauce factory) will be collected and discharged to public sewerage system. A sewerage impact assessment is prepared separately with the sewerage connection proposed included. The standards for effluents discharged into foul sewers leading into government sewage treatment plants as stipulated under Water Pollution Control Ordinance is observed and will be complied with by installing necessary onsite wastewater treatment facilities before discharge. On the other hand, future operator will be responsible to apply for the discharge arrangement and apply necessary license for operation of the soy sauce factory.

5.4.3 Requirement specified under EPD's practice note ProPECC PN 1/23 "Drainage Plans subject to Comments by the Environmental Protection Department" will be observed and complied with for drainage and sewerage system design, and will be clearly specified in future tender document so that contractor needs to follow.

5.4.4 The Application Site is current unsewered. The soy sauce factory currently in operation adopted sequencing batch reactor (SBR), treatment technology to process the wastewater, with a valid discharge license from EPD allowing discharge of treated effluent to the nearest stormwater outlet of Kam Tin River. The sewage from the relocated Soy Sauce Factory is to be discharged according to existing discharge license. The wastewater from the relocated Soy Sauce Factory will be treated by new onsite WWTP, based on latest treatment technology designed for soy sauce production process (i.e. tertiary treatment level). The treated effluent will be discharged into public sewerage system. The operator will operate the factory with a valid wastewater discharge license under the Water Pollution Control Ordinance (WPCO) to ensure that the pollutant loading is control within the acceptable limit. As the project is in preliminary stage, detailed design for the onsite WWTP would be provided later.

5.4.5 The operator will be responsible to re-apply necessary license such as variation of discharge license under Section 15 of Water Pollution Control Ordinance for effluent discharge and will equip necessary wastewater treatment facility.

5.4.6 There will be no direct discharge of untreated surface runoff and effluent to surrounding water sensitive receiver. No unacceptable water quality impact would be resulted due to future operation of the soy sauce factory.

5.5 Conclusion

5.5.1 Potential environmental air quality, noise and water quality impacts arising from future operation of the relocated soy sauce factory have been assessed. Environmental mitigation measures have been proposed to eliminate or minimise the potential impact.

5.5.2 A odour impact assessment regarding the relocated soy sauce factory has been conducted. No adverse odour impact is expected based on the assessment result. Updated assessment would be carried out in later detailed design stage in case of any change of design information to investigate the odour impact to the nearby air sensitive

receivers. Adequate mitigation measures would be recommended so that no adverse odour impact is envisaged.

5.5.3 With the recommended mitigation measures in place, no insurmountable environmental impacts arising from the operation of the relocated soy sauce factory are anticipated.

6. CONSTRUCTION PHASE IMPACTS

6.1 Introduction

6.1.1 During the construction phase of the proposed development, there may be potential air quality, noise and water quality impacts upon the nearby sensitive receivers such as villages. Waste generation is another consideration. Practicable environmental mitigation measures are recommended to reduce these impacts to acceptable ranges.

6.2 Fugitive Dust and Gaseous Emission

6.2.1 The major air quality impact of concern during the construction phase will be the potential fugitive dust emission. The major dust emission sources during the construction phase of the Proposed Development are expected to arise from construction activities during site formation stage such as:

- Excavation resulting in exposed ground vulnerable to air erosion;
- Earth moving, loading and unloading of excavated material;
- Wind effect on material stockpiling; and
- Vehicle movements on haul roads and over the construction site.

6.2.2 There will be potential impacts from the criteria pollutants (e.g. nitrogen dioxide (NO_2), sulphur dioxide (SO_2), and carbon monoxide (CO)). Emission from diesel trucks for the haulage of materials and construction plants will contain high percentage of smoke particulate and unburned hydrocarbons in comparison with petrol driven vehicles. Ultra-low sulphur diesel (ULSD) with sulphur content not exceeding 0.005% by weight will be used as fuel to minimize SO_2 emission. In all circumstances, the contractor will be required to observe all relevant regulations and maintain all equipment in good condition to avoid any excessive emission. Under the Air Pollution Control (Non-road Mobile Machinery) (Emission) Regulation, only approved or exempted non-road mobile machineries (including mobile generator, air compressor, excavator, crawler crane, bulldozer and etc.) with a proper label are allowed to be used in the construction site. In addition, availability of electricity supply during construction of the project will be explored and such requirement will be specified in future contract. If available, contractor should maximise use of electricity and with least reliance of diesel fuelled equipment (e.g. for electricity powered stationary equipment such as pump instead of using generator).

6.2.3 There are some villages located within 500m from the Application Site and considered as Air Sensitive Receivers (ASRs). **Figure 6.1** shows the separation distance between the Application Site and the nearby ASRs. Separation distance between the Application Site and the OU(CDWRA)1 Site and the nearby air/noise sensitive receivers is shown in **Table 6.1**.

Table 6.1 Separation Distance between the Application Site and Nearby Air/Noise Sensitive Receivers

ID	Identified ASR/NSR	Separation Distance from Application Site	Separation Distance from OU(CDWRA)1 Site
ASR1 / NSR1	Village House of Wing Kei Tsuen B6A	~330m to the north	~80m to the north
ASR2 / NSR2	Village House of Mo Fan Heung 1	~130m to the east	~134m to the east
ASR3 / NSR3	Village House of Sha Po Tsuen 8	~450m to the southeast	~630m to the south
ASR4 / NSR4	Village House	~10m to the west	~220 to the south

6.2.4 The proposed development is designed so that relocated soy sauce factory and reserved school site is located on southern portion and built area (where site formation and excavation take place) at the northern portion. It is estimated that about 180,000m^3 of excavated material will be generated. Assuming a period of 2 years for site formation and excavation, it will generate around 40 truckload per day, and average of about 4 truckload per hour. On the other hand, another planning application (Application No.: Y/YL-NSW/8) for OU(CDWRA)1 site to the immediate north have been submitted. It is assumed that the tentative completion years of the proposed development at the application site and at this adjacent site are both 2031. It is likely that site formation and excavation work will be carried out concurrently at these 2 sites. It is estimated that about 430,000m^3 of excavated material will be generated. Assuming a period of 2 years for site formation and excavation, about 10 truckload per hour will be generated for OU(CDWRA)1 site. Cumulative fugitive dust impact during concurrent construction of these two projects is anticipated. In addition, a newly proposed public housing development has been committed to the east across San Tin Highway of the subject Application Site at Sha Po (RNTPC Paper No. 9/22). The proposed public housing development in Sha Po will be finished by Year 2031 tentatively. Since the proposed development and another project for OU(CDWRA)1 site are tentatively completed by 2031, it is possible that there are concurrent construction activities of the public housing development as well. Yet, since the location of the public housing site is separated from the proposed development by the San Tin Highway (around or more than 200m apart), the contribution of cumulative impact on sensitive receivers nearby the proposed development is insignificant.

6.2.5 Besides, there is an approved planning application at Wing Kei Tsuen (Application No.: Y/YL-NSW/7) located at the further north of the Proposed Development. The site will be developed as a comprehensive development with wetland restoration area and tentatively to be completed by 2028. In addition, it is noted that the proposed Northern Link (Approved EIA Report No.: AEIAR-259/2024) is tentatively completed by 2034, which is 3 years later than the Proposed Development. It is possible that there are concurrent construction activities of the proposed development, the proposed Wing Kei Tsuen development and the proposed NOL. Yet, the Wing Kei Tsuen development and the proposed NOL are separated with the Proposed Development by 350m and 150m respectively. The contribution of cumulative impact on sensitive receivers nearby the Proposed Development is considered to be insignificant. Therefore, the contribution of cumulative impact on sensitive receivers nearby the proposed development is insignificant. The location of the concurrent projects is shown in **Figure 6.2**. In all circumstances, it is believed that best management practice will be implemented for all concurrent projects. Further, due to the proximity of the Proposed Development and the project for OU(CDWRA)1 site, it is recommended that the contractors of all

the concurrent projects in the vicinity should have close liaison to avoid any dusty activities to be taken place at the same time or at locations nearby to minimise the cumulative dust impact.

6.2.6 The proposed development includes relocation of soy sauce factory, formation of site reserved for school, excavation of basement for car parking facilities. erection of residential towers and associated facilities. The site topography is generally flat so that no extensive site formation work is required. Excavation, piling and superstructure works are typical of many residential developments in Hong Kong. There are well established practices (e.g. paving of main haul road, water spraying, wheel washing, speed limit, high hoarding, stockpile covered and located away from ASR) to suppress dust emission. Since the Project is at the early stage, relevant information is not available yet. However, any phasing of the construction works for the excavation / site formation areas will be considered during the detailed design stage. It is considered that the potential fugitive dust impact can be practicably mitigated.

6.2.7 Fugitive dust emission arising from construction activities can be effectively suppressed by incorporating proper mitigation measures into work procedures through contractual clauses with reference to EPD's Recommended Pollution Control Clauses for Construction Contracts, where applicable, good site management, and close monitoring by the resident engineers. The contractor shall be required to follow the requirements of the Air Pollution Control (Construction Dust) Regulations. With the adaptation of good practices, it is expected that emission of construction dust can be kept at an acceptable level. Environmental monitoring and audit (EM&A) programme will be planned and implemented during the construction phase of the proposed development.

Mitigation Measures

6.2.8 The recommended dust mitigation measures are described below.

General Site Management

6.2.9 As discussed, the contractor would establish communication channel with the contractor of the nearby concurrent projects (i.e. OU(CDWRA)1 Site, proposed public housing development in Sha Po, proposed Wing Kei Tsuen development, proposed NOL). In particular, there would be close liaison to avoid dusty activities be taken in place at the same time or at locations neat to each other to minimise the fugitive dust impact.

6.2.10 Appropriate working methods should be devised and arranged to minimise dust emissions and to ensure any installed control system and/or measures are operated and/or implemented in accordance with their design merits. Electric power supply to the on-site machinery shall be provided as far as practicable in order to minimize any air emissions. No free falling of construction debris should be allowed, which should be let down by hoist or enclosed tunnel to the ground.

6.2.11 Higher hoarding shall be erected along the site boundary of the project where there is ASR in close proximity" as control measures. A high standard of housekeeping shall be maintained. Any piles of materials accumulated on or around the work areas shall be cleaned up regularly. Cleaning, repair and maintenance of all plant facilities within the work areas shall be carried out in a manner that does not generate fugitive dust emissions. Prior to cleaning, the materials should be handled properly to prevent fugitive dust emission. Any exposed earth shall be properly treated by compacting or hydro seeding, within 6 months after the last construction activity.

6.2.12 Frequent mist/ water spraying should be applied on dusty areas. The frequency of spraying will depend upon local conditions such as rainfall, temperature, wind speed

and humidity. The amount of water spraying should be just enough to dampen the material without over-watering which could result in surface water runoff.

Vehicles and Unpaved Site Roads

6.2.13 Dust emission from unpaved roads comes predominantly from travelling of vehicles. Areas within the site where there are regular vehicle movements should have an approved hard surface. Speed controls at an upper limit of 10km/hr should be imposed and their movements should be confined to designed roadways within the site. All dusty vehicle loads should have side and tail boards covered by tarpaulin extending at least 300mm over the edges of the side and tail boards. Wheel-wash troughs and hoses should be provided at exit points of the site.

Material Stockpiling and Handling

6.2.14 The amount of stockpiling should be minimised where possible. Construction material or debris should be covered and stored inside enclosed areas. Other control measures such as enclosed or semi-enclosed windboard should be used, where applicable, to minimise dust emission. Regular watering is needed at areas such as storage piles, where there could be potential dust emission.

6.3 Construction Noise Impact

6.3.1 During the construction phase of the proposed development, major noise impacts would arise from piling works, operation of Powered Mechanical Equipment (PME), and construction-related traffic.

Construction Noise Criteria

6.3.2 Construction noise is controlled under the Noise Control Ordinance (NCO) which prohibits the use of powered mechanical equipment (PME) during the restricted hours (7 p.m. to 7 a.m. on normal weekdays and any time on a public holiday, including Sunday) without a valid Construction Noise Permit (CNP) from the Authority. The criteria and procedures for issuing such a permit are specified in the "Technical Memorandum on Noise From Construction Works Other than Percussive Piling" (TM1). While there is no planned construction works to be carried out during the restricted hours, TM1 should be followed in case there is any need to carry out works in such time period in future.

6.3.3 With effect from 1 November 96, the use of specified powered mechanical equipment (SPME) for carrying out construction work other than percussive piling and/ or the carrying out of prescribed construction work (PCW) within a designated area are also brought under control. The relevant technical details are provided in the "Technical Memorandum on Noise from Construction Work in Designated Areas" (TM2).

6.3.4 Percussive pilling is controlled similarly by a construction noise permit system and described in the NCO and the "Technical Memorandum On Noise From Percussive Piling" (TM3) which restrict the number of hours during which piling can be conducted. Percussive piling is prohibited between 7 p.m. and 7 a.m. and on holidays (including Sundays). Percussive piling during the daytime (i.e. between 7 a.m. and 7 p.m. on any day not being a holiday) may be carried out in accordance with the permitted hours and other conditions under a valid construction noise permit.

6.3.5 For construction works other than percussive piling, although TM1 does not provide control over daytime construction activities, noise limits as shown in below table are set out in the "Practice Note for Professional Persons Environmental Consultative Committee" (ProPECC) PN/2 issued in 1993.

Table 6.2 Noise Limit for Daytime Construction Activities

NSR	0700 to 1900 Hours on Any Day Not Being a Sunday or General Holiday, Leq (30 min), dB(A)
Dwelling	75
School	70 (65 during examinations)

Notes:

(i) The above standards apply to uses which rely on opened windows for ventilation;

(ii) The above standards shall be viewed as the maximum permissible noise levels assessed at 1 m from the external façade.

6.3.6 As tabulated in **Table 6.1**, the nearest NSR is over 130m apart. With long separation distance maintained, significant construction noise impact is not anticipated. In all circumstances, future contractor will be required to exercise adequate mitigation measures to minimise potential construction noise impact on the surrounding noise sensitive uses.

Mitigation Measures

6.3.7 Sufficient noise mitigation measures should be introduced in the development to alleviate potential noise impacts on nearby NSRs. The Contractor(s) will be required under the contract to ensure regular maintenance of all plant and equipment, and that noise generation at source would be minimized and practicable noise mitigation measures would be in use. The Contractor(s) will be required to adopt quiet type construction plants (e.g. EPD's quality powered mechanical equipment (QPME) inventory), wherever practicable. Similarly, quieter method other than percussive piling will be adopted as far as practicable for any piling works subject to ground investigation result (which usually dictates the piling method). Movable noise barriers will also be erected around noisy plants in order to minimize noise generation at source. With these measures in place noise generation due to construction activities would be minimized.

6.3.8 The following general noise mitigation measures are recommended for implementation:

- Application of properly designed silencers, mufflers, acoustically dampened panels and acoustic sheds or shields, etc.;
- Use of electric-powered equipment where applicable instead of diesel-powered or pneumatic-powered equipment;
- Erecting noise enclosures/ movable noise barriers around noisy plants;
- Only well-maintained plants should be operated on-site;
- Plants should be serviced regularly during the construction programme;
- Noisy activities can be scheduled to minimize exposure of nearby NSRs to high levels of construction noise. For example, noisy activities can be scheduled for midday or at times coinciding with periods of high background noise;
- Noisy equipment such as emergency generators shall always be sited as far away as possible from noise sensitive receivers;
- Location of noise emitting plants at maximum possible distances from sensitive receivers;
- Contractual clauses for construction works; and

- Schedule of noisy operations during non-restricted hours where possible.

6.3.9 The above-mentioned noise mitigation measures will be included in the contractual clauses for implementation by the contractor(s) during the construction stage. With these measures in place, construction noise due to the Proposed Development can be minimized, and no significant noise impact is anticipated.

6.4 Water Quality and Construction Wastewater Impact

Source of Construction Wastewater

6.4.1 Construction activities would inevitably have the potential to generate wastewater and affect the nearby water quality. Works should be carried out in such a manner so as to minimise significant impacts on local water bodies. Activities that are likely to cause water pollution include:

- Construction runoff and drainage;
- Sewage effluent from the site; and
- Liquid spillage, e.g. oil, diesel, solvents etc.

6.4.2 Construction runoff contains increased loads of sediments, other suspended solids and contaminants. Potential sources of pollution include runoff and erosion from the site surfaces, drainage channels; bentonite slurries and other grouting materials and drainage from dust suppression sprays, fuel, oil and lubricants from construction vehicles and other equipment.

6.4.3 Water sensitive receivers exist in the immediate surrounding of the Application Site (see **Figure 1.3**). Precautionary measures should be incorporated to avoid and minimise potential water quality impact on the water sensitive receivers.

Mitigation Measures

6.4.4 The good practice given in the Practice Notes for Professional Persons on "Construction Site Drainage" (ProPECC PN 2/23) in controlling water pollution at construction site shall be implemented during the construction phase of the Proposed Development. Soil erosion from the construction site can be minimised through good on-site management practices by implementing viable erosion control measures which should be incorporated in contract clauses. The main practices provided in the above-mentioned document (i.e. ProPECC PN 2/23) are also summarized in the following paragraphs which should be enforced to prevent unacceptable construction stage impacts and for compliance with the statutory criteria.

Construction Site Runoff

- Exposed soil surfaces should be protected from rainfall through, for example, by covering temporarily exposed slope surfaces or stockpiles with tarpaulin and protect temporary access roads by crushed stone or gravel;
- Exposed soil areas should be minimised to reduce the potential for increased siltation and contamination of runoff;
- Minimise the time that soil surfaces are exposed;
- Slow down water run-off flowing across exposed soil surfaces;
- Channels, earth bunds or sand bag barriers should be provided on site to properly direct surface runoff through drainage systems;
- Oil interceptors are also recommended to be provided for stormwater drains near plant maintenance/ repair areas, where necessary.

- Manholes (including newly constructed ones) should be adequately covered or temporarily sealed so as to prevent slit, construction materials or debris from getting into the drainage system;
- Construction works should be programmed to minimise soil excavation works where practicable during rainy conditions (in particular works nearby water body such as offsite sewer pipe laying work alongside river and near meander);
- Drainage facilities must be adequate for the controlled release of storm flows;
- Sedimentation basins and sand traps designed in accordance with the requirements of ProPECC Note PN 2/23 should be installed at the construction site for collecting surface runoff. Perimeter channels at site boundaries should be provided where necessary to intercept surface runoff from outside the site. Silt removal facilities, channels and manholes should be maintained and deposited silt and grit should be removed regularly;
- There should be no direct discharge without treatment of construction site runoff into the nearby streams and public drains;
- The Contractor shall prepare a construction site drainage management plan with details of the construction phase drainage system proposed to be constructed; discharge location(s); and screening facilities;
- The Contractor(s) shall apply for a discharge licence under the WPCO and the discharge shall comply with the terms and conditions of the licence throughout the construction phase;
- Construction works should be arranged so that there should be no disturbance to water quality at the nearby stream. Construction site runoff should be intercepted by drains so that there will be no direct discharge without treatment into the nearby stream and other sensitive areas; and
- Apart from works within the Application Site, there will be offsite construction work for laying of sewer pipeline. A section of pipeline serving the proposed development and another being planned development to the immediate north will be constructed alongside river and near meander. In addition, there will be site formation work. Sand bag will be berthed alongside the water body to minimise any construction material/excavated soil/debris from getting into water body.

Wastewater from Construction Site

- Sewage generated from the construction workforce should be contained by chemical toilets before connection to public foul sewer can be provided. The number of chemical toilets required would be subject to the capacity of the chemical toilets, and contractor's practices/ work programme. The Contractor(s) will be required to provide an estimation on the amount of sewage to be generated and to provide sufficient number of chemical toilets for construction workers. The chemical toilets should be serviced and cleaned by a specialist contractor at regular intervals. No discharge of sewage into nearby environment will be allowed during construction stage. Such requirements will be incorporated into relevant contractual clauses of this Proposed Development for proper implementation;
- Foul water from canteens on-site, if any, should also be contained by chemical toilets before connection to public foul sewer can be provided;

- Vehicle wheel washing facilities should be provided at every site exit such that mud, debris, etc. deposited onto the vehicle wheels or body can be washed off before leaving the site area;
- Section of construction road between the wheel washing bay and the public road should be paved with backfill to reduce vehicle tracking of soil and to prevent site run-off from entering public road drains; and
- If bentonite is used, bentonite slurry should be reconditioned and reused as far as practicable. Spent bentonite should be kept in a separate slurry collection system for disposal at a marine spoil grounds subject to obtaining a marine dumping licence from EPD. If used bentonite slurry is to be disposed of through public drainage system, it should be treated to the respective effluent standards applicable to foul sewers, storm drains or the receiving waters as set out in the WPCO Technical Memorandum on Effluent Standards in accordance with ProPECC PN 2/23.

Oils and Solvents

- Spillage of fuel oils or other polluting fluids should be prevented at source. It is recommended that all stocks should be stored inside proper containers and sited on sealed areas, preferably surrounded by berms;
- Regular site inspections to ensure the proper implementation of the above measures shall be carried out.

6.5 Construction Waste Disposal

Legislation and Construction Waste Impact

6.5.1 The principal legislation controlling waste materials in Hong Kong is the Waste Disposal Ordinance (WDO) (Cap. 354) and its subsidiary regulations.

6.5.2 Construction activities for the Proposed Development will generate waste materials requiring appropriate management and disposal. Likely range of waste types includes:

- Excavated C&D materials and site clearance waste;
- Wood from formwork as non-inert C&D materials;
- General refuse generated by the workforce; and
- Chemical and oily wastes due to maintenance of equipment.

6.5.3 The general waste management strategy is to avoid waste generation in the first place. If that is unavoidable, source reduction and segregation should be exercised as far as practicable and at the same time, recycling and reuse should be adopted to salvage as much as possible all the recyclable and reusable materials.

Construction Waste Disposal Measures

6.5.4 Contractor will be required to develop and implement a proper waste management plan (WMP) according to the PNAP ADV-19 to devise proper procedures to segregate, store and delivery/disposal or recyclable/non-recyclable materials.

6.5.5 On-site sorting of construction wastes will be recommended. On-site sorting can be achieved by avoiding the generation of "mixed waste" through good site control.

6.5.6 Waste generated by construction activities should be sorted into inert C&D materials and non-inert C&D materials. The inert C&D materials which comprise soil, rock, concrete, brick, cement plaster/mortar, inert building debris, aggregates and asphalt shall be reused in earth filling, reclamation or site formation works. The non-inert C&D

materials which comprises metal, timber, paper, glass, junk and general garbage shall be reused or recycled and, as the last resort, disposal of at landfills.

6.5.7 It is estimated that about 180,000 m^3 of inert C&D material and 20,000 m^3 of non-inert C&D material will be generated during the course of construction. Adequate areas for sorting and storage of segregated materials should be provided onsite. Construction wastes shall be sorted, with the inert C&D material broken up into small pieces for disposal at public fill reception facility, and the non-inert C&D material should be disposed of at landfill.

6.5.8 To estimate the general refuse generated during construction phase, an assumption of 300 workers per day with 0.65 kg per worker per day has been made. **Table 6.3** presents the estimation of waste generated during construction phase.

Table 6.3 Summary Table of Estimated Waste during Construction Phase

Waste Material	Total Quantity Generated	Handling	Disposed offsite/reused and quantity
Inert C&D Material	~180,000 m^3	Sorted into inert C&D material and delivered to public fill reception facilities	~180,000 m^3 to be delivered to public fill reception facility (minimal for reuse onsite)
Non-Inert C&D Material	~20,000 m^3	Collected and segregated where practicable, and collected by/delivered to recycler	~1,000 m^3 to be collected by/delivered to recycler ~19,000 m^3 to be disposed of at designated landfill site
General Refuse	~200 kg per day	Collected using adequate containers/bins and provide onsite collection point for collection	Collected by refuse collection vehicle and disposed of at designated landfill site
Chemical Waste	Anticipated to be limited (around some hundred litres at most)	Collected by licensed collectors	Chemical Waste Treatment Centre or equivalent

Note: The above estimated quantities are subject to the detailed design stage.

6.5.9 Construction wastes shall be sorted, with the inert C&D materials broken up into small pieces for disposal at public fill reception facility, and the non-inert C&D materials should be disposed of at landfill.

6.5.10 Chemical and oily wastes generated from the construction activities, vehicle and plant maintenance and oil interceptors should be disposed of as chemical waste in strict compliance with the Waste Disposal (Chemical Waste) (General) Regulations.

6.5.11 Waste disposal from construction site is subject to control under the Waste Disposal Ordinance.

6.6 Land Contamination Review

6.6.1 The Application Site is located to the west of Castle Peak Road – Tam Mi. It is currently occupied by Koon Chun Sauce Factory, open storage and a strip of shrubland.

Historic and Current Land Uses

6.6.2 Historic aerial photos taken in year 1949, 1963, 1975, 1989, 1995, 2004, 2015, 2019, 2021 and 2022 are shown in **Appendix 6.1**. It is generally composed of farmland and ponds in year 1949 to 1963. According to the soy sauce factory website, the factory occupied the northern portion of the Application Site since 1967 and no change of use till now. From year 1975 to 1989, the site mainly consisted of ponds and the soy sauce factory. In year 1995, the pond at east of sauce factory was filled and the southern portion of the site was paved. In year 2004, the pond was paved and the southern portion became container storage area. From year 2015 till now, the paved area east of soy sauce factory left vacant and turned into shrubland. The container storage area is still located on the southern portion of the Application Site and in operation.

Table 6.4 Land Use Summary on the Application Site

Year	Land Use / Description	Owner / Occupier	Source of Information	Off-site Property Affected?
1949	The Application Site was a mix of farmland and ponds with some village houses located at the northwest corner.	No information available	Aerial photos from Lands Department	No
1963	The Application Site was a mix of farmland and ponds. It is observed that construction works for Koon Chun Sauce Factory was in progress at the northeast portion. The houses identified in 1949 were no longer exist.	No information available	Aerial photos from Lands Department	No
1975	Most of the site was ponds and the sauce factory located was already established at the northeast corner.	No information available	Aerial photos from Lands Department	No
1989	There is no change of landuse comparing to year 1975.	No information available	Aerial photos from Lands Department	No
1995	The pond at the northwest corner was filled. Southern portion of the site was paved. No change is observed on the sauce factory.	No information available	Aerial photos from Lands Department	No
2004	The filled pond was further paved and left vacant. The southern paved area became container storage area. No change is observed on the sauce factory.	No information available	Aerial photos from Lands Department	No

2015	The northwest paved area changed into shrubland. No change is observed on the sauce factory and container storage area.	No information available	Aerial photos from Lands Department	No
2019	There is no change of landuse comparing to year 2015.	No information available	Aerial photos from Lands Department	No
2021	There is no change of landuse comparing to year 2019.	• Applicant • Government • Third party	Aerial photos from Lands Department	No
2022	There is no change of landuse comparing to year 2021.	• Applicant • Government • Third party	Aerial photos from Lands Department	No

Information from Government Departments

6.6.3 Apart from the historic aerial photos, the following Hong Kong Special Administration Region (HKSAR) Government Departments have been enquired on the latest update on the availability of land use status and records of land contamination and/or spillage of the Application Site. The summary of correspondence is tabulated in **Table 6.5** below. Copy of letters which the Consultant sent to various Government Departments and relevant replies are shown in **Appendix 6.2**.

6.6.4 Building Records Access and Viewing On-line (BRAVO) of Building Departments (BD) was visited in January 2024 to obtain records for completed private buildings. Several records of building, structure, drainage, alternation & additions, site formation, minor works for the Koon Chun Sauce Factory were found. This finding is in line with the current land use at the Application Site. The captured screen of BRAVO is provided in **Appendix 6.3**.

6.6.5 As advised by Planning Department (PlanD), the Consultant visited the Town Planning Board Statutory Planning Portal 3 to obtain records for land zoning. The website as of 04 January 2024 has confirmed that the Application Site falls within areas zoned "Industrial (Group D) (I(D))" and "Open Storage (OS)"on the Approved Nam Sang Wai OZP (No. S/YL-NSW/8).

6.6.6 As advised by Fire Service Department (FSD), no Dangerous Goods Licence is issued regarding the Application Site. Several incidents are reported in the vicinity but none of them happened within the Application Site.

6.6.7 As advised by Hong Kong Police Force (HKPF), there was no explosive incident in their database at the Application Site.

6.6.8 As advised by Environmental Protection Department (EPD), the Consultant visited the territory-wide register of chemical waste producers (CWPs) maintained at EPD's Territory Control Office. The register record as of 13 October 2023 has recorded two chemical waste producers at the Application Site, namely Ocean World Enterprise Limited (Recycling) and Koon Chun Hing Kee Soy & Sauce FTY Ltd (Sauce product manufacturing).

Table 6.5 Enquires and Responses on Land Contamination Related Records in the Application Site

Consultant's Letter Ref.	Department	Response Letter Ref.	Response Date	Summary
SHKOUIOSEI00_0_0003L.22	Environmental Protection Department	() EP910/E6/1	29/07/2022	There is no record of chemical spillage accident and submission relating to land contamination assessment at the Subject Site in the past 3 years. A visit to the Territorial Control Office for chemical waste producer registry inspection was performed. According to the register record as of 13/10/2023, no record is found at the Application Site.
SHKOUIOSEI00_0_0004L.22	Fire Service Department	(6) in FSD GR 6-5/4 R Pt.42	15/07/2022	Appointment letter from client to be provided for accurate information search in the database.
		(66) and (72) in FSD GR 6-5/4 R Pt.42	02/08/2022	There is no Dangerous Goods Licence issued at the Subject Site. Several incidents are reported in the vicinity but none of them happened within the site.
SHKOUIOSEI00_0_0005L.22	Hong Kong Police Force	(71) in CP OPS EOD 6-20/1 Pt.5	27/07/2022	There was no explosive incident in EOD's database at the subject site.
SHKOUIOSEI00_0_0006L.22	Planning Department	() in Y/YL-NSW/8&9	19/07/2022	The subject site falls within an area zoned "Industrial (Group D)" and "Open Storage" (No. Y/YL-NSW/9) on the approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8 (OZP).
-	Lands Department	Topographic Map available from Lands Department was reviewed. The Application Site was occupied by the Koon Chun Sauce Factory, ponds and a strip of plantation from year 1982 to 1994. The sauce factory remains at the same location since then. From year 1996 to 2004, the southern portion of the site was "Works in Progress". From year 2004 to 2024, the southern portion remains as open storage. The pond was filled and paved later. Topographic Map records generally tally with observations in aerial photos.		

Discussion and Observation

6.6.9 Based on the above, the desktop review of historic information indicated that the Application is characterized by a mixture of rural landscape, ponds and Koon Chun Sauce Factory. Major changes of land use status in the area were observed around year 1963 and 2004. The soy sauce factory started to be erected around year 1963 and open storage at southern portion was established in year 2004 since then.

6.6.10 According to the site survey conducted in Mar 2022 and Nov 2023, Ocean World Enterprise Limited was not identified. Its recorded address on EPD's register refers to the open storage area, where only containers were observed. Therefore, it is confirmed that Koon Chun Sauce Factory is the only current CWP onsite.

6.6.11 Koon Chun Sauce Factory is paved. There was no sign of obvious/ suspected contamination such as oil staining, abnormal odour, distress vegetation, dangerous goods storage. However, as the soy sauce factory holds a CWP licence and involves industrial operations, it is recommended to perform a detailed land contamination assessment in later stage (i.e. after the factory is vacant) to determine the presence and extent of contamination onsite.

6.6.12 It was also observed that the Open Storage was used as temporary storage of containers. Compressed gas, construction tools, abandoned wood, generators, oil stains were identified at grade. It is therefore considered that there is potential land contamination problem within the open storage area. There was CWP existed at the Open Storage area before.

6.6.13 That the potentially contaminating activities might have caused contamination over time cannot be ruled out at this stage. Therefore, a detailed land contamination assessment will be carried out in the later stage to identify the needs of Contamination Assessment Plan (CAP) and/ or Site Investigation (SI), which will be conducted at the identified hot spots to determine the presence and extent of contamination on site.

6.6.14 Subject to the findings of the CAP and SI, a Contamination Assessment Report (CAR) would be prepared to present the findings and evaluate the level and extent of potential contamination. If land contamination is identified and remediation is required, a Remediation Action Plan (RAP) would be prepared to recommend specific remediation measures. All contaminated soil would need to be remediated specific remediation measures and in accordance with Practice Guide with the agreement from EPD.

6.6.15 Upon completion of remediation works, if any, a Remediation Report (RR) would be prepared to demonstrate the clean-up works are adequate. All documents (including CAP, CAR, RAP and RR) would be submitted to EPD for approval prior the commencement of any construction or development works.

6.7 Conclusion

6.7.1 Potential environmental impacts arising from construction activities of the Proposed Development, including air quality, construction wastewater, noise and waste impacts have been assessed. No insurmountable environmental impacts are anticipated from the Proposed Development with the implementation of environmental mitigation measures.

6.7.2 According to the historical and existing use observed in site survey, it is considered that there is potential land contamination problem in the Application Site suggested due to nature of previous and/or current land uses. Further verification including necessary SI which may trigger requirement to prepare CAP, CAR etc. is considered to be required according to the EPD Guidance Note for Contaminated Land Assessment and Remediation as well as the Practice Guide for Investigation and Remediation of Contaminated Land. The land contamination assessment is required and remediation (if necessary) shall be completed before development works among the potentially contaminated area at the Application Site. The Applicant is required to conduct further site re-appraisal to update the land contamination assessment to take into account the latest situation of the Site, in order to assess any change in land usage which might give rise to potential land contamination issues and to ascertain contaminative sources and hot spot of contamination.

7. CONCLUSION

7.1.1 Potential industrial noise and emission, vehicular emission and railway noise impacts have been evaluated and considered acceptable, due to absence of industrial emission source within 200m from the Application Site, absence of aboveground railway system within 300m from the Application Site, remoteness and insignificance of industrial noise source, adequate separation maintained from carriageways meeting HKPSG requirement.

7.1.2 It is noted that the existing soy sauce factory onsite will be relocated to its southern portion. There are various measures to be incorporated into this relocated soy sauce factory which will be implemented by the Applicant, e.g. the relocated soy sauce factory is designed without chimney stack to eliminate stack emission and mechanical ventilation with deodorization units. According to the OIA report provided in **Appendix 5.1**, with proper implementation of mitigation measures recommended in the OIA, adverse odour impact on existing uses and planned uses is not anticipated. Noisy facilities will be designed to meet HKPSG standard (Acceptable Noise Level – 5 dB(A) or prevailing background whichever is lower). Proper drainage system and onsite wastewater treatment plant will be constructed to treat effluent to acceptable standard before discharge. Treated effluent from the onsite wastewater treatment plant will be discharged to public sewerage system. The operator will be responsible to re-apply necessary license such as variation of discharge license under Section 15 of Water Pollution Control Ordinance for effluent discharge and will equip necessary wastewater treatment facility. There is no direct discharge of untreated wastewater to surrounding water body. No unacceptable environmental noise, air quality, odour and water quality impact due to future operation of the soy sauce factory is anticipated.

7.1.3 The Proposed Development (other than the relocated soy sauce factory) is generally non-environmental polluting in nature. There is no chimney stack. However, noisy equipment such as AC system of retail and clubhouse area, fan system of covered transport lay-by will possibly be provided onsite. As this is in early planning stage of the project, there is lack of detail such as type of equipment, location, orientation, etc. Nevertheless, the requirement to meet HKPSG standard is well noted and will be followed. The covered transport lay-by will be designed so that the exhaust louver will be facing road and away from any nearby air sensitive uses (not limited to the proposed development) as far as possible. EPD's ProPECC PN 1/22 on Control of Air Pollution in Semi-Confined Public Transport Interchanges will be followed for the design and operation of the proposed transport lay-by such that the air quality guidelines set out in the PN are met under all conditions. In fact, there is no nearby air sensitive uses close to the tentative exhaust louver location so that adverse air quality impact due to the operation of covered transport lay-by is not anticipated.

7.1.4 The potential road traffic noise impact on the Proposed Development has been assessed quantitatively. Noise mitigation measures in terms of self-protecting building design (including blank wall), vertical acoustic fin, acoustic window/door (baffle type), door with auto-closing mechanism and fixed glazing (with or without maintenance window) are proposed. With the recommended noise mitigation measures in place, no adverse road traffic noise impact on future residential dwellings is anticipated. Regarding the primary school development, the orientation should be carefully designed to avoid facing road directly. Air conditioning and better insulation are recommended as the last resort.

7.1.5 Fixed noise impact assessment has also been conducted. The assessment result demonstrates that the predicted noise levels at selected NSRs comply with the relevant noise criteria and no at-receiver noise mitigation measure is required. It is understood that there will be potential AC outdoor units proposed for clubhouse, mechanical

ventilation for carpark and covered transport lay-by, etc. It is noted that the detailed design is subject to finetuning and after respective contractors engaged. To avoid adverse noise impact on the surrounding NSRs, the future contractor shall ensure that the equipment within the Proposed Development would be designed and installed to meet the HKPSG criteria.

7.1.6 Potential environmental impacts arising from construction activities of the Proposed Development, including air quality, construction wastewater, noise and waste impacts have been qualitatively assessed. No insurmountable environmental impacts are anticipated with the implementation of environmental mitigation measures.

7.1.7 Based on the preliminary review at this rezoning stage, it is noted that the Application Site should have been used for soy sauce manufacturing & storage and containers open storage. Compressed gas, construction tools, abandoned wood, generators, oil stains were identified in the open storage area at grade. Potential land contaminating problems were considered possible onsite. The land contamination assessment is required and remediation (if necessary) shall be completed before development works at the Application Site.

7.1.8 In conclusion, there is no unacceptable environmental noise, air quality, water quality, odour and waste impacts anticipated on or arising from the proposed development with the recommended environmental mitigation measures properly implemented.

Attn: Mr. Billy Fan

Dear Mr. Fan,

Section 12A Planning Application for Proposed Amendments to the Nam Sang Wai Outline Zoning Plan from "I(D)", "OS" and "Road" Zones to "R(E)" Zone at Lots 1910 RP(Part) and 1743 S.C RP (Part) in D.D. 107 and Adjoining Government Land, West of Castle Peak Road – Tam Mi, Yuen Long
(Planning Application No. Y/YL-NSW/8)

Traffic Forecast for Noise Impact Assessment

We write to confirm that Transport Department's endorsed methodology prepared by us has been strictly adopted in preparing the traffic forecast for the Road Traffic Noise Impact Assessment prepared by Ramboll Hong Kong Ltd.

Thank you for your kind attention.

Yours faithfully,
For and on behalf of
AECOM Asia Co. Ltd.

Report Suspicious

Dear SY,

I have no objection in principle to your proposed methodology of traffic forecast for Environmental Assessment Study.

Best regards,
Phil CAI

Legend	
Acoustic Window (Baffle Type)	AW(BT)
Acoustic Door (Baffle Type)	AD(BT)
Door with Auto-Closing Mechanism	S.D.

-	Non-residential unit

Remark: The predicted noise levels are not the actual noise levels at the external façade after the application of innovative noise mitigation measures (acoustic window/door). These predicted noise levels are the equivalent noise levels at 1m from the external façade after accounting the reduction in noise levels inside the room offered by the proposed noise mitigation measures.

Appendix 2.5 Estimation of Noise Attenuation of Acoustic Window/Door

	Application Site							Reference								Sound Attenuation			
Description	Outer opening width, m	Outer opening height, m	Outer opening area, m^2	Air gap, m	Overlapping length, m	MPA applied?	Room area (RA), m^2	Outer opening width, m	Outer opening height, m	Outer opening area, m^2	Air gap, m	Overlapping length, m	MPA applied?	Room area (RAref), m^2	Ref. sound attenuation, dB(A)	Room Size Adjustment: 10xlog(RA / RAref) (adjust downward only), dB(A)	Additional Sound Attenuatin from MPA, dB(A)	Additional Sound Attenuatin from SAM, dB(A)	**Adjusted Sound Attenuatin, dB(A)**
Acoustic Window	0.600	1.165	**0.7**	0.100	0.253	1mm	4.5	0.600	1.165	**0.7**	0.100	0.253	1mm	6.8	6.9	-1.8	0.0	1.5	6.6

Appendix 3.1 Extract of Northern Link EIA (Approved EIA Report No.: AEIAR-259/2024)

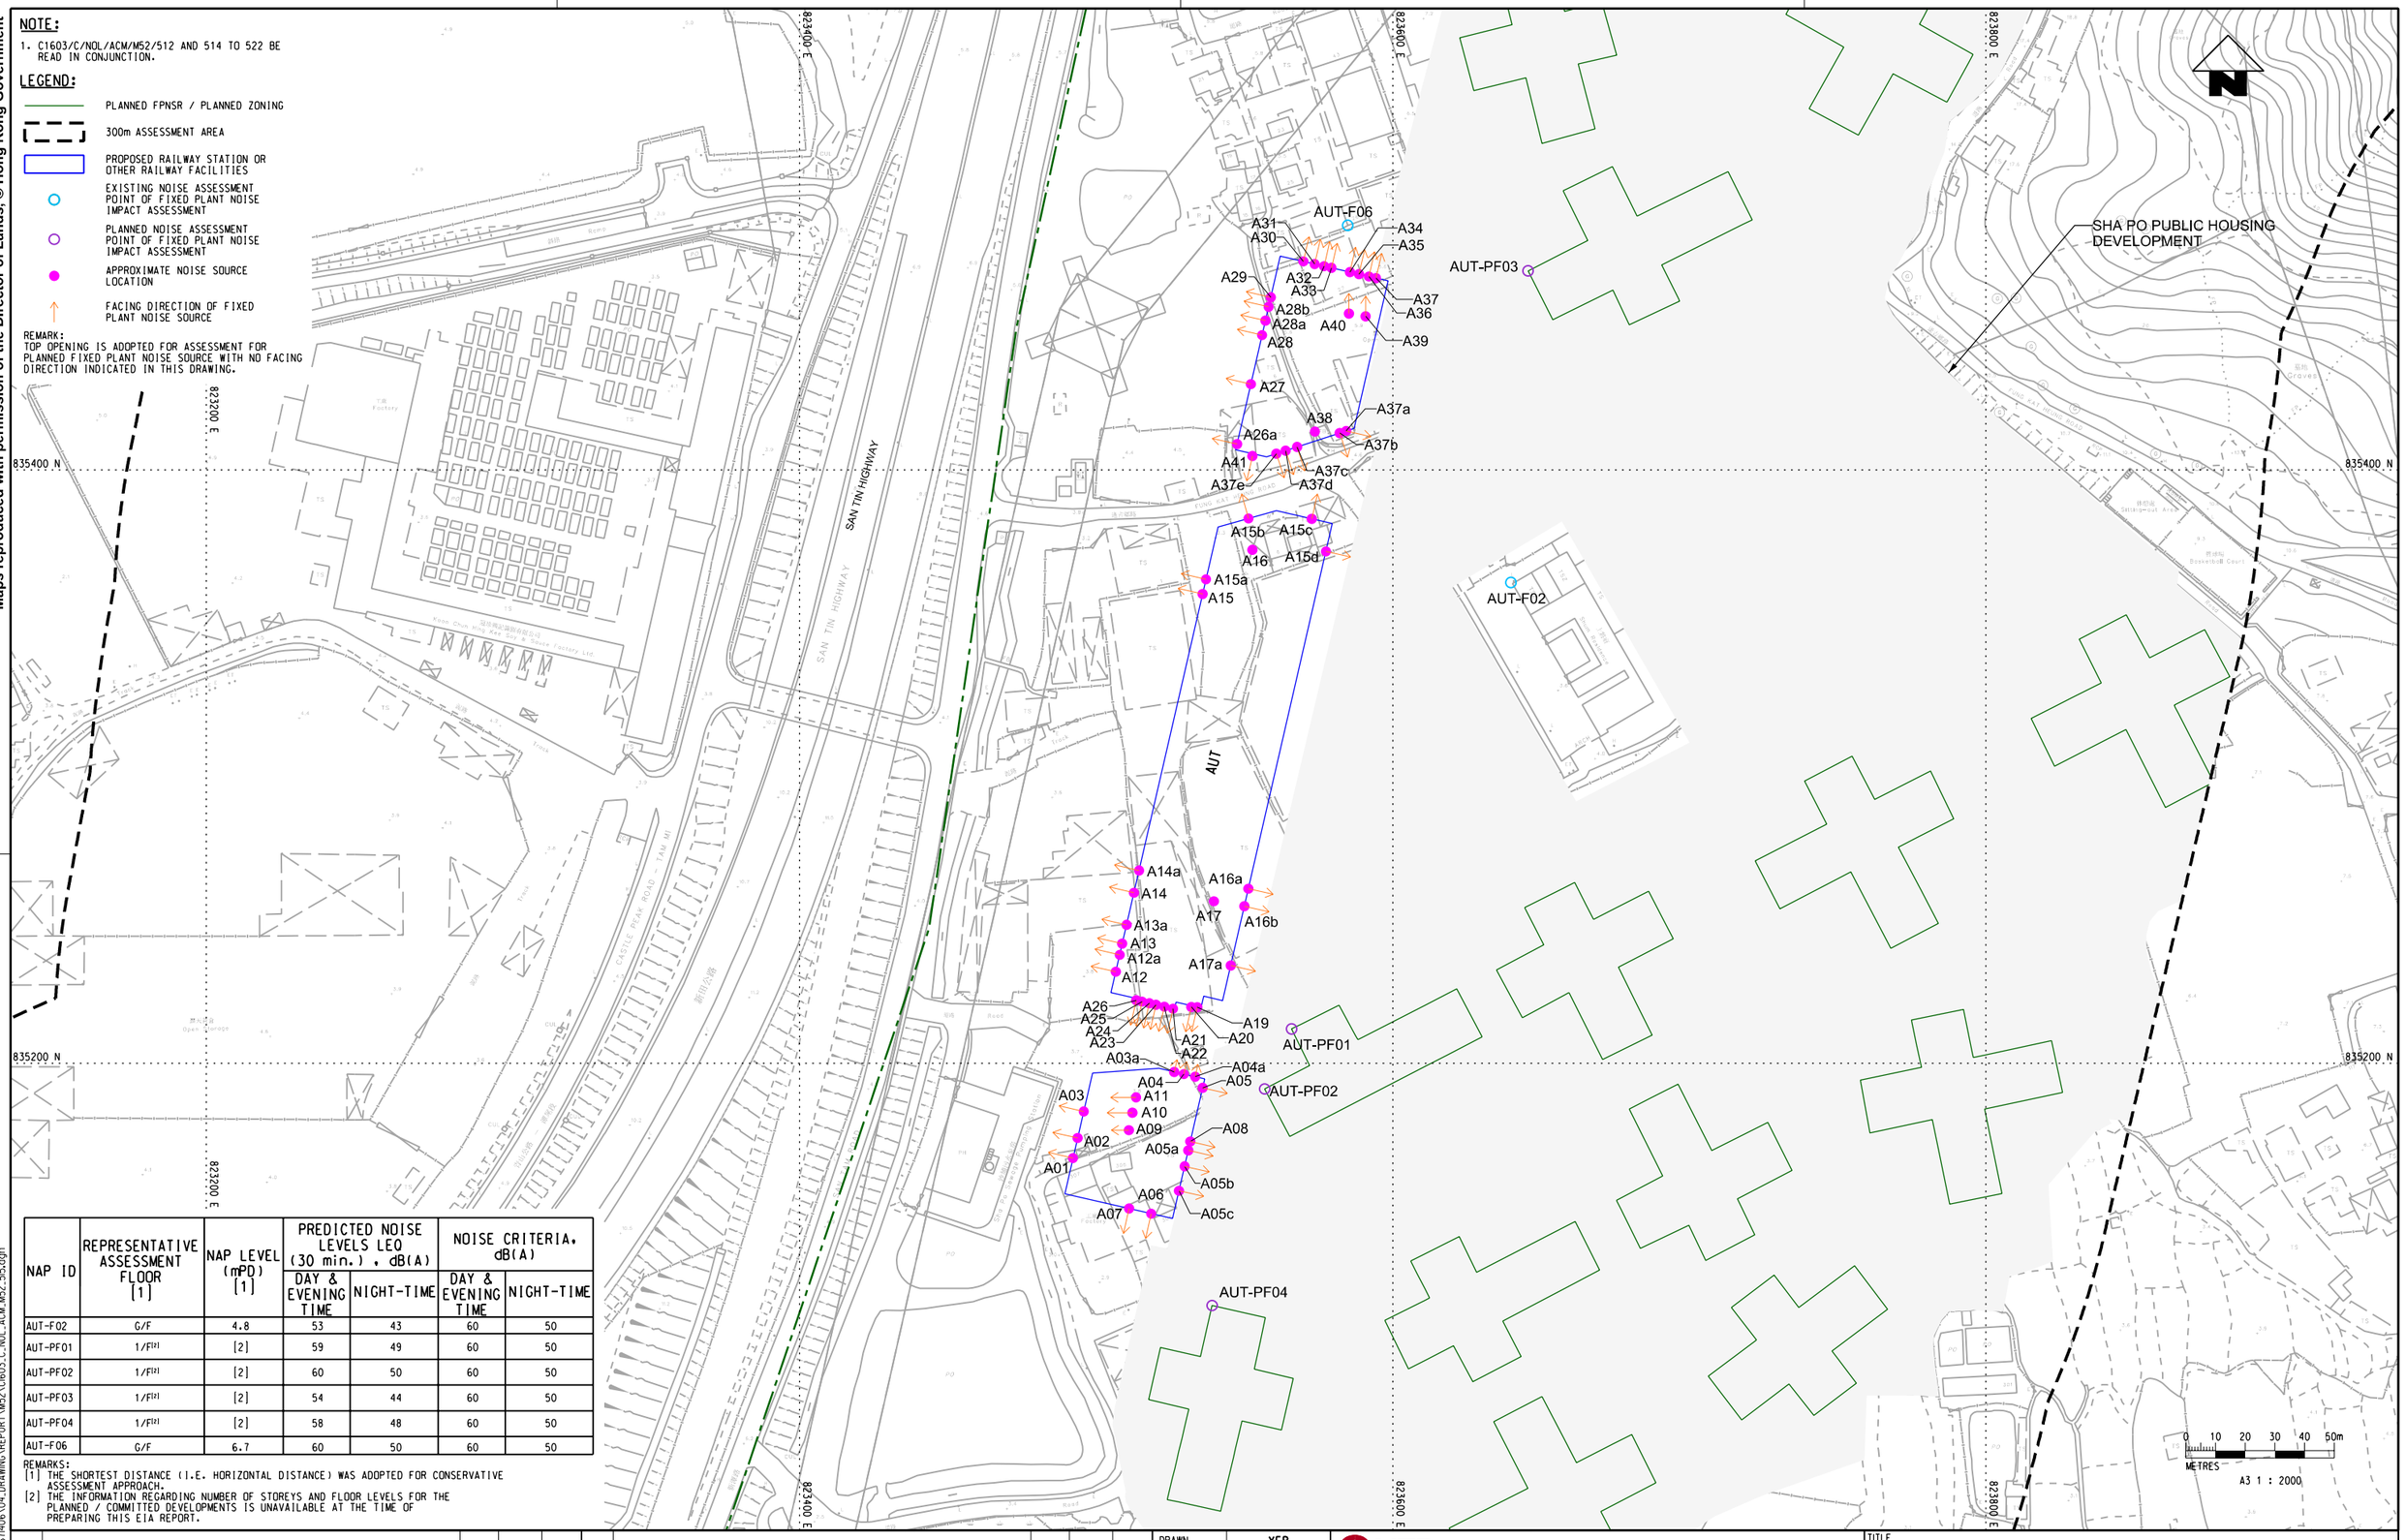
NOTE:

1. C1603/C/NOL/ACM/M52/512 AND 514 TO 522 BE READ IN CONJUNCTION.

LEGEND:

- PLANNED FPNSR / PLANNED ZONING
- 300m ASSESSMENT AREA
- PROPOSED RAILWAY STATION OR OTHER RAILWAY FACILITIES
- EXISTING NOISE ASSESSMENT POINT OF FIXED PLANT NOISE IMPACT ASSESSMENT
- PLANNED NOISE ASSESSMENT POINT OF FIXED PLANT NOISE IMPACT ASSESSMENT
- APPROXIMATE NOISE SOURCE LOCATION
- FACING DIRECTION OF FIXED PLANT NOISE SOURCE

REMARK:
TOP OPENING IS ADOPTED FOR ASSESSMENT FOR PLANNED FIXED PLANT NOISE SOURCE WITH NO FACING DIRECTION INDICATED IN THIS DRAWING.



NAP ID	REPRESENTATIVE ASSESSMENT FLOOR [1]	NAP LEVEL (mPD) [1]	PREDICTED NOISE LEVELS LEQ (30 min.), dB(A)		NOISE CRITERIA, dB(A)	
			DAY & EVENING TIME	NIGHT-TIME	DAY & EVENING TIME	NIGHT-TIME
AUT-F02	G/F	4.8	53	43	60	50
AUT-PF01	1/F[2]	[2]	59	49	60	50
AUT-PF02	1/F[2]	[2]	60	50	60	50
AUT-PF03	1/F[2]	[2]	54	44	60	50
AUT-PF04	1/F[2]	[2]	58	48	60	50
AUT-F06	G/F	6.7	60	50	60	50

REMARKS:
[1] THE SHORTEST DISTANCE (I.E. HORIZONTAL DISTANCE) WAS ADOPTED FOR CONSERVATIVE ASSESSMENT APPROACH.
[2] THE INFORMATION REGARDING NUMBER OF STOREYS AND FLOOR LEVELS FOR THE PLANNED / COMMITTED DEVELOPMENTS IS UNAVAILABLE AT THE TIME OF PREPARING THIS EIA REPORT.

4.6.9 The maximum SWLs of the fixed plant noise sources of the Project are presented in **Table 4.10**. Detailed noise calculations for daytime and evening (i.e. 0700 – 2300 hours) and night-time (i.e. 2300 – 0700 hours) operations are shown in **Appendix 4.11**. The predicted noise impacts at different NAPs with various representative floor levels are presented in **Appendix 4.13**.

Dear Steven,

I have no adverse comment to your proposed road type.

Best regards,
Phil CAI

Subject: RE: "OU(CDWRA)" (Application No. Y/YL-NSW/8) and "I(D)" / "OS" (Application No. Y/YL-NSW/9) (Road Classification)

Dear Mr Hao

Castle Peak Road -Tam Mi (Road Link B- section fronting the development site as shown in the attached sketch), it is a 7.3m wide single 2 lane carriageway. Under the 2021 ATC(Station No 5257) , Castle Peak Road -Tam Mi (section between Fairview Park Boulevard & Lok Ma Chau Road) is classified as Rural Road. Under the 2021 ATC(Station No 5505) , Tam Mi Road (south of Fairview Park Boulevard) is also classified as Rural Road. In view of similar traffic characteristics / road function, the Castle peak Road – Tam Mi fronting the development site (ie Road Link B) should also be classified as Rural Road.

Pok Wai South Road (Road Link A as shown in the attached sketch), it is a single track access road with passing bays. The road serving minimal traffic access to the nearby developments and hence it should be classified as Feeder Road under the hierarchy of Rural Road Types.

See you have any comment on this road classification. Thanks

1. INTRODUCTION

1.1 Background

1.1.1 The Application Site currently falls within the "Industrial (Group D) ("I(D)"), "Open Storage" ("OS") and "Road" zones in Yuen Long. The Applicant proposes to rezone from "I(D)", "OS" and "Road" zones to "Residential (Group E)" ("R(E)") zone in support of a comprehensive development, reserved school site and Relocated Soy Sauce Factory (name "R(E)" Site).

1.1.2 Ramboll Hong Kong Limited is commissioned by the Applicant to prepare the Odour Impact Assessment arisen from the Relocated Soy Sauce Factory. Potential odour impact assessment has been discussed in this context.

1.2 The Relocated Soy Sauce Factory and Its Environs

1.2.1 The existing soy sauce factory is located at the northern portion of the Application Site and the existing soy sauce factory onsite will be relocated to the southern side of the Application Site in future.

1.2.2 The Relocated Soy Sauce Factory is bounded by Castle Peak Road – Tam Mi section, San Tin Highway, Tsing Long Highway to the east and Pok Wai South Road to the west. To the immediate west is an existing meander zoned "Open Space" ("O"). The proposed comprehensive development and reserved school site are to the immediate north.

1.2.3 The surrounding area to the west is mainly ponds, river and meander. To the further north situates the proposed OU(CDWRA)1 Site under a separate planning application, some village type developments and open storage yard. The area to the east separated by heavy trafficked road includes Mo Fan Heung and Fung Kat Heung (with factory and open storage uses and some scattered village houses), Sha Po Sewage Pumping Station, Sha Po Tsuen and a residential development (Park Yoho).

1.2.4 **Figure 1.1** shows the location of the Relocated Soy Sauce Factory and its environment.

1.3 Relocated Soy Sauce Factory

1.3.1 The Relocated Soy Sauce Factory will comprise indoor areas including warehouse, raw material store room, fermentation room (for 1st fermentation), kitchen (including cooking area), plant room, office, and wastewater treatment plant and outdoor sun-drying area (for 2nd fermentation of the fermented soybean mixed with brine under sunshine), .

1.3.2 The indicative Layout Plans and Sections of the Proposed Relocated Soy Sauce Factory are shown in **Annex 1.1**.

1.4 Appraisal of Environmental Impacts

Odour Impact

1.4.1 The existing soy sauce factory would be relocated to the southern part of the Application Site. The sources of odour from the Relocated Soy Sauce Factory will mainly be the fermentation room (i.e. the 1st fermentation process), the concrete tanks at outdoor sun-drying area (i.e. the 2nd fermentation of the fermented soybean mixed with brine under sunshine), soy sauce extraction, bean paste collection, the kitchen (i.e. cooking process of products) and the wastewater treatment plant. More information is provided in **Section 2.1**.

1.4.2 As advised by the operator of Koon Chun Hing Kee Soy & Sauce Factory, for normal operation, only one concrete tank at the outdoor sun-drying area would be opened at each time for collecting the bean paste for subsequent cooking procedure. For the assessment purpose, a very conservative approach has been adopted which is assuming three concrete tanks to be opened simultaneously for collecting bean paste. Fifteen scenarios for different peripheral locations at outdoor sun-drying area have been identified for the scenarios, in which three concrete tanks are assumed to be opened simultaneously. The scenarios are based on the distribution of nearby proposed ASRs in the Proposed Development and existing & planned ASRs in the surrounding area. In each scenario, 3 opened concrete tanks located nearest to the ASRs are selected to represent the worst-case scenario.

1.5 Organization of this Report

1.5.1 The organization of remaining section of this report is:

- Section 2 is an odour impact assessment; and
- Section 3 is a concluding summary.

2. ODOUR IMPACT ASSESSMENT

2.1 Introduction

2.1.1 The major air quality impact arisen from the production of traditional soy sauce and other related products as observed should be odour emission.

2.1.2 This assessment predicts odour level, informing the provision of air quality mitigation measures of the Relocated Soy Sauce Factory to ensure existing and planned air sensitive receivers are not exposed to unacceptable levels of odour impacts. The odour impacts are predicted at representative air sensitive receivers (ASRs) within the Proposed Development and 500m assessment area through the use of quantitative computer modelling, and are compared with the odour assessment criterion of 5 Odour Unit (OU) based on an averaging time of 5 seconds as stipulated in Annex 4 of EIAO-TM.

2.1.3 The assessment area of 500m from the Relocated Soy Sauce Factory is shown in **Figure 2.1**. The study has also considered nearby identified potential odour source within 500m of the Relocated Soy Sauce Factory, which is Sha Po Sewage Pumping Station. Onsite surveys were conducted to assess the odour impacts at sources.

2.1.4 Odour units are converted to value at averaging period of 5 seconds in order to compare to criteria stated in the Technical Memorandum of Environmental Impact Assessment Ordinance (EIAO-TM). Appropriate mitigation measures will be recommended if exceedances of odour criterion of 5 OU.

Proposed Operation of the Relocated Soy Sauce Factory and Potential Odour Impact

2.1.5 Koon Chun Hing Kee Soy & Sauce Factory (Koon Chun), the operator of the existing soy sauce factory and the proposed Relocated Soy Sauce Factory (the operator), has been interviewed and 5 onsite surveys have been conducted for the existing soy sauce factory on 9 February 2022, 29 July 2022, 14 October 2022, 19 October 2023, 25 October 2023.

Information Provided by Operator

2.1.6 According to the operator, Koon Chun was founded in 1928 and has been established in its current location in Yuen Long since 1967. Due to its long history of making reputable traditional sauces, Koon Chun would continue its traditional sauce making process (i.e. to prepare the sauces in a natural way and bath under the sun for months during the fermentation process) to maintain the product quality in the future.

2.1.7 The Relocated Soy Sauce Factory will follow the same traditional sauce production practices of the existing soy sauce production facilities, including types of manufacturing products, capacities, production process, arrangement for fermentation process, etc.

2.1.8 The procedures of the unique soy sauce, bean-based product and other related products production includes screening and steaming of soybeans, fermentation of soybeans (1st fermentation) in fermentation room, 2nd fermentation of the fermented soybeans mixed with brine under sunshine inside concrete tanks at outdoor sun-drying area and food processing of soy sauce, bean-based products and other related products in the kitchen. Excluding the procedures at the outdoor sun-drying area (i.e. 2nd fermentation, soy sauce extraction and bean paste collection, all the procedures will be carried out within the building of the Relocated Soy Sauce Factory. For a more detailed depiction of the production procedures, please refer to the drawings illustrating the production procedures enclosed in **Annex 2.1**.

Operation Time

2.1.9 As advised by the operator, the Relocated Soy Sauce Factory would be operated from 8:00 a.m. to 6:00 p.m., Monday to Friday. The majority of potential odour emissions process such as soy sauce extraction, bean paste collection, and food processing in the kitchen would be processed during operational hours. The fermentation processes in the fermentation room and outdoor sun-drying area would run 24 hours a day to create an optimal environment for fermentation of the soybean. Additionally, the wastewater treatment plant would also operate around the clock.

Fermentation Room

2.1.10 As advised by the operator, the indoor temperature in the fermentation room will be maintained at around 40°C to 48°C automatically for providing an optimal condition for the fermentation of the soybean. To control the indoor temperature, the heating system will be turned on to increase the indoor temperature when the temperature is too low; while the exhaust fans will be turned on to purge the air and lower the indoor temperature when the temperature is too high as well as ceasing the fermentation process when the fermentation process is completed.

Outdoor Sun-drying Area

2.1.11 According to the information provided by the operator, same as the existing soy sauce factory, the concrete tanks will be adopted and placed at the open outdoor sun-drying area of the Relocated Soy Sauce Factory for 2nd fermentation.

2.1.12 The concrete tanks will be covered with transparent plastic pane for hygiene and weather reasons. As advised by the operator, when the 2nd fermentation process is finished, the soy sauce would be extracted to the storage tanks via pipelines (i.e. the soy sauce would be extracted by a closed system and without need to open the cover). After all the soy sauce is extracted, the concrete tank will only be opened for collecting bean paste when it is necessary to use for food processing. The transparent plastic pane will cover the concrete tank until the bean paste being collected from the concrete tank.

2.1.13 Moreover, only 1 concrete tank with cover removed for collecting bean paste process at the same time was observed during the onsite surveys of the existing soy sauce factory. It is advised that the design capacity of the existing and the Relocated Soy Sauce Factory has been optimized with individual stages of process balanced. Therefore, the amount of products produced does not only depend on the capacity of the kitchen, but also the capacities of the fermentation process and the assembly process (i.e. bottling and packaging process). The scale and the production process of the Relocated Soy Sauce Factory would be same as the existing one, and it is not possible to increase the production rate in one particular stage of process to increase the throughput. In other words, the operational scenario is generally stable. The future operation of the Relocated Soy Sauce Factory will be the same as the existing operation as advised by the operator.

Kitchen

2.1.14 As advised by the operator, there are 13 woks provided in the existing soy sauce factory. For the Relocated Soy Sauce Factory, there will be maximum 11 woks provided. Although the number of woks provided in the Relocated Soy Sauce Factory will be less than those provided in the existing soy sauce factory, but the number of woks provided in the Relocated Soy Sauce Factory will be enough for maintaining the same throughput and the capacity of each wok provided will be same as before.

2.1.15 Moreover, as advised by the operator, only one wok would be used for cooking the soy sauce/bean-based products each time. After one wok of product is being cooked,

the cooked product would be pumped to the bottling and packaging area for further processing which is located within the kitchen. Then another wok would be used for cooking the product (i.e. the above process would be repeated again). The bottling area is a fully enclosed system with no exhaust. Therefore, no odour would be released to the kitchen during the bottling process. Afterwards, the filled bottles/cans are transferred to the nearby packaging area via conveyor belts, which is semi-enclosed. Therefore, small amount of odour would be released during the packaging process (before the bottles/cans are covered/sealed). As the packaging area is located within the kitchen, the odour released during the packaging process would also be extracted by the exhaust fans of the kitchen and hence the odour samples collected at/near the kitchen's exhaust fans should include the odour released during the packaging process. The future bottling and packaging area would also be designed within the kitchen.

2.1.16 During food processing process, odour emissions are expected from the enclosed kitchen (with doors and windows closed), and the mechanical ventilation will be turned on to exhaust the odour emission to the environment. Odour mitigation measures such as odour removal system connected to mechanical ventilation exhaust will be provided in the Relocated Soy Sauce Factory.

Wastewater Treatment Plant

2.1.17 According to the information provided by the operator, aeration treatment is being adopted for the treatment of wastewater generated from the kitchen only. Therefore, fine bubble aeration would ensure the aerobic bacteria and other micro-organisms to decompose the organic contaminants in the wastewater and mixing would also take place that there is no settling of suspended solid. Dissolved oxygen control is also integrated with the aeration as such different amount of oxygen (i.e. air bubble) would be provided by the system automatically such that the wastewater never turns septic and no unpleasant odour will be generated. The Wastewater Treatment Plant consists of two aeration tanks and 1 storage tank connected in series. The untreated wastewater would be pumped into the 1st aeration tank and treated by 1st aeration treatment. After the 1st aeration treatment, the wastewater would be pumped into the 2nd aeration tank and treated by 2nd aeration treatment. After the 2nd aeration treatment, the treated wastewater will be pumped into the 3rd storage tank for storage and discharge.

General Work Processes

2.1.18 Among all processes, fermentation room, 2nd fermentation, collecting bean paste from the concrete tanks, cooking and food processing of soy sauce, bean-based products and other related products (i.e. the kitchen) and wastewater treatment plant would result in odour emission as advised by the operator and also observed in onsite surveys. It is noted that the wastewater treatment plant of the existing soy sauce factory is located in open area (i.e. the odour generated by aeration tanks would be emitted directly to the environment) and the kitchen and the fermentation room (the fermentation room is separated from the kitchen) of the existing soy sauce factory are equipped with exhaust fans only (i.e. the odour generated in the kitchen and fermentation room would be exhausted and emitted to the environment via the exhaust fans directly while the windows/doors are being closed due to hygiene requirement).

2.1.19 The work processes of Relocated Soy Sauce Factory are shown in **Annex 2.1**. The design of the Relocated Soy Sauce Factory will have some enhancements. The wastewater treatment plant will be located within a plant room of the building and the odour sources, including the plant room of the wastewater treatment plant, kitchen and fermentation room will be fully enclosed and will rely on mechanical means for

ventilation. No window will be provided for the plant room of the wastewater treatment plant and its door will be closed. The windows and doors of kitchen and fermentation room will be closed due to hygiene requirement and to avoid any odour released to the environment via the windows and doors. The extracted air of all these odour sources would be treated with deodorization unit at the exhaust before being released to the ambient. The exhaust will be installed at location farthest away from proposed residential development which is air sensitive in nature. The oil interceptor in the Relocated Soy Sauce Factory will be covered and the odour impact arising from the oil interceptor is considered insignificant. Moreover, only wastewater from the oil interceptor will be pumped to the wastewater treatment plant. Therefore, additional odour to the wastewater treatment plant from the oil interceptor would not be expected.

2.2 Assessment Criteria

2.2.1 Annex 4 of EIAO-TM stipulates that the odour level at air sensitive receiver should meet 5 odour units based on an averaging time of 5 seconds for odour prediction assessment.

2.3 Air Sensitive Receivers (ASRs)

2.3.1 Representative ASRs in the proposed development and in the surrounding are selected to assess the odour impact induced by the Relocated Soy Sauce Factory. Their locations and the relevant PATH Grids in the Proposed Development and the surrounding are shown in **Figure 2.2** and **Figure 2.3**. Details of the assessment points are shown in **Table 2.1** and **Table 2.2**. According to the observation during onsite survey, a temporary structure was used for storage. Therefore, this temporary structure would not be identified as ASR. The photo of this temporary structure is shown in **Annex 2.8**. In addition, according to the onsite survey and desktop review, the nearest ASRs identified in the south direction of the Relocated Soy Sauce Factory across Tsing Long Highway would be Park YOHO which is over 300m away from the boundary of the Relocated Soy Sauce Factory. Therefore, no nearby ASR has been identified in this direction.

Table 2.1 Representative ASRs in the Proposed Development for Odour Impact Assessment

ASR Label	No. of Storeys	Local Ground, mPD	Flagpole Height, mAG	Assessment Height, mPD
A1 to A22	29	4.5	1.5 – 110.5	6.0 – 115.0

Table 2.2 Representative ASRs in the Surrounding for Odour Impact Assessment

ASR Label	Description	No. of Storeys	Local Ground, mPD	Flagpole Height, mAG	Assessment Height, mPD	Distance from Boundary of the Relocated Factory, m
S1	Temporary Structure	2	2.9	1.5 – 5.4	4.4 - 8.3	~5
S2	Temporary Structure	2	2.9	1.5 – 5.4	4.4 - 8.3	~7
S3	Temporary Structure	2	2.9	1.5 – 5.4	4.4 - 8.3	~8
S4	Temporary	2	3.5	1.5 – 5.4	5 – 8.9	~9

ASR Label	Description	No. of Storeys	Local Ground, mPD	Flagpole Height, mAG	Assessment Height, mPD	Distance from Boundary of the Relocated Factory, m
	Structure					
S5	Temporary Structure	2	4.4	1.5 – 5.4	5.9 – 9.8	~14
S6	Resting place at Castle Peak Road – Tam Mi	-	4.5	1.5	6.0	~30
S7[1]	CDA Site	14	3	1.5 – 43.5	4.5 - 46.5	~135
S8	Temporary Structure	3	3.2	1.5 – 8.1	4.7 – 11.3	~185
S9	Village House	3	3.8	1.5 – 8.1	5.3 – 11.9	~155

Note:
[1] Planned ASR of a CDA Site with the no. of storeys and the flagpole height assumed based on the information of the OZP (S/YL-KTN/11).

2.4 Odour Impact Assessment Methodology

Meteorological Data

2.4.1 Hourly meteorology data (Grids (27,47), (27,48), (27,49), (28,47), (28,48), (28,49)) for a full year is extracted from the PATH v3.0 released by EPD in January 2024. Hourly wind speeds lower than 0.5m/s (i.e. calm wind condition) are corrected to 0.5m/s. Hourly Pasquill stability classes are extracted from the PATH v3.0 released by EPD in January 2024. Hourly mixing heights are capped between the minimum and maximum value measured at King's Park AWS (2019), i.e. 119m and 2009m.

Computer Modelling for Odour

2.4.2 The dispersion of odour was modelled using AERMOD software released by Lakes Environmental Software. The model is based on the principle of Gaussian dispersion and is widely accepted by EPD and is used in this assessment to predict both concentration and deposition of pollutants from point and area sources.

2.4.3 Land use types surrounding the proposed Relocated Soy Sauce Factory, the albedo, Bowen ratio for the 10km x 10 km area, surface roughness for the 1km area, and the Surface File and Profile File to be used as input in AERMOD are downloaded and extracted from the AERMET tool in the Smart Air Modelling Platform v1.1 (SAMP v1.1) released by EPD in January 2024. The relevant information is provided in **Annex 2.2**.

Derivation of Emission Rates

Odour Sampling

2.4.4 Since the Relocated Soy Sauce Factory is not in place yet, direct odour sampling to determine the odour emission rate is not feasible. Reference has been made to the odour sampling results of the odour sources in the existing soy sauce factory for deriving the odour emission rate of the Relocated Soy Sauce Factory which is the best available information and also considered highly relevant (as discussed, the capacity, product, process, etc. of the existing factory and Relocated Soy Sauce Factory are the same).

2.4.5 The odour samplings have been conducted for the fermentation room, kitchen, outdoor sun-drying area and the wastewater treatment plant in existing soy sauce factory at the weather condition conditions of approximately 30°C. It is also

confirmed that the odour samplings were collected on the days and periods within maximum operation of the factory to avoid underestimation of odour impact.

2.4.6 For the fermentation room, odour samples were collected simultaneously inside the fermentation room and at the exhaust fan of the fermentation room. Only one exhaust fan was being operated and the windows/ doors/ openings were closed (i.e. the air was extracted to the outdoor via the exhaust fan only) while the odour samples were being collected. Therefore, the exhaust fan is the only emission point while the odour sample was being collected. With a conservative approach, the highest measured odour concentration among the samples collected inside the fermentation room and at the exhaust fan of the fermentation room would be adopted for the derivation of the emission rate of the exhaust of the fermentation room of the Relocated Soy Sauce Factory. It is confirmed that the odour samplings were collected for the fermentation room while it was under full capacity/ with maximum operation to avoid underestimation of the odour impact, which could represent the worst-case situation for both existing and proposed Relocated Soy Sauce Factory operation.

2.4.7 Similar to the fermentation room, odour samples were collected simultaneously inside the kitchen and at the exhaust fan of the kitchen while the bean-based product was being cooked. Only one exhaust fan was operating and the windows/ doors/ openings were closed (i.e. the air was extracted to the outdoor via the exhaust fan only) while the odour samples were being collected. Therefore, the exhaust fan is the only emission point while the odour sample was being collected. With a conservative approach, the highest measured odour concentration among the samples collected inside the kitchen and at the exhaust fan of the kitchen would be adopted for the derivation of the emission rate of the exhaust of the kitchen of the Relocated Soy Sauce Factory. It is confirmed by the operator that the odour samplings were collected for the kitchen while it was under full capacity/ with maximum operation and collected for the product with strongest smell generated to avoid underestimation of the odour impact, which could represent the worst-case situation for both existing and proposed Relocated Soy Sauce Factory operation.

2.4.8 Besides, odour samplings at the outdoor sun-drying area during concrete tank closed situation, and during concrete tank opened with collecting bean paste process have been collected. As mentioned in **Sections 2.1.12** to **2.1.13**, only 1 concrete tank will only be opened at each time for collection of bean paste after all the soy sauce is extracted. Therefore, the concrete tanks after extraction of all soy sauce were selected for the odour sampling in order to reflect the real situation of the operation of the existing soy sauce factory.

2.4.9 As mentioned in **Section 2.1.17**, two aeration tanks and 1 storage tank in the wastewater treatment plant are connected in series. The odour was not observable from 3rd storage tank during the onsite survey as 3rd storage tank is used for the storage and discharge of treated water. For the wastewater treatment plant, odour samplings were collected at 1st aeration tank and 2nd aeration tank as the odour impact arisen from 3rd storage tank was insignificant. Therefore, the emission rate of the 3rd storage tank was calculated based on the SOER of the 2nd aeration tank as a conservative approach.

2.4.10 The summary of odour samplings and odour sampling reports of the odour sources in the existing soy sauce factory are shown in **Annex 2.3**. The odour samples collected and adopted for the derivation of the emission rates of the odour sources are summarized in **Annex 2.4**.

2.4.11 The predicted results of the subject Odour Impact Assessment demonstrate that the current rezoning application is technically feasible from odour perspective. If the

Government considers appropriate to review the design of the factory at subsequent implementation stages, the Odour Impact Assessment can be further reviewed with further odour samples to be collected under different weather conditions and submitted to Government for review (e.g. under S16 planning application as submission of S16 planning application is required for the Relocated Soy Sauce Factory after this stage of rezoning application). Relevant proposed mitigation measures can also be reviewed (if necessary) accordingly.

Assumption for odour impact modelling

2.4.12 It is assumed that soy sauce extraction and bean paste collection from the concrete tanks, and food processing in the kitchen of the Relocated Soy Sauce Factory will be processed from 8 a.m. to 6 p.m. (which is maximum number of operation hours).

2.4.13 For assessment purpose, the odour emission from open area of concrete tank is assumed 24 hours a day and with emission rate derived based on corresponding odour sampling result.

2.4.14 Odour emission from wastewater treatment plant is also assumed 24 hours a day and with emission rate derived based on corresponding odour sampling result.

2.4.15 Odour emission from the kitchen is assumed to be made from 8am to 6pm during operating hours of the factory and with emission rates derived based on maximum odour concentration measured by capturing worst emission scenario as advised by the operator and with multiplying with the flowrate of the exhaust fan of the kitchen of the existing soy sauce factory.

2.4.16 Odour emission from the fermentation room is assumed 24 hours a day and with emission rate derived based on maximum odour concentration measured by capturing worst emission scenario as advised by the operator and with multiplying with the flowrate of the exhaust fan of the fermentation room of the existing soy sauce factory.

2.4.17 As mentioned in **Section 2.1.13**, only 1 concrete tank with cover removed was observed during the onsite surveys of the existing soy sauce factory. Moreover, for a very conservative approach, a total of 3 concrete tanks being opened simultaneously would be assumed to represent the worst-case scenario. Therefore, assuming three concrete tanks to be opened simultaneously for ten hours from 8 a.m. to 6 p.m. in the air modelling is considered a very conservative approach.

Scenarios of Different Locations of Concrete Tanks

2.4.18 Fifteen scenarios for different peripheral locations are assumed for the three concrete tanks to be opened simultaneously during collecting bean paste have been defined. The scenarios established are based on distribution of the nearby proposed ASRs and the nearby existing & planned ASRs in the surrounding. For each scenario, 3 opened concrete tanks located nearest to representative ASRs (i.e. the most affected nearby representative ASRs) are selected and therefore considered to represent the worst-case scenario. That is, in each scenario, the three concrete tank locations nearest to ASRs on one particular direction are selected. The representative ASRs with the worst scenario under each scenario and the shortest distance between the ASRs and opened concrete tanks are shown in the **Table 2.3**:

Table 2.3 Most Affected ASRs with the Fifteen Worst Scenarios

Scenario	Most Affected ASR	Shortest Distance Between ASR and Opened Concrete Tank
Scenario 1	S1 – S5	~46m (between S4 and Tank – OU7_1)

Scenario	Most Affected ASR	Shortest Distance Between ASR and Opened Concrete Tank
Scenario 2	S1 – S5	~47m (between S4 and Tank OU7_2)
Scenario 3	S1 – S5	~47m (between S5 and Tank OU7_3)
Scenario 4	S1 – S5	~47m (between S5 and Tank OU9_4)
Scenario 5	S1 – S5	~41m (between S5 and Tank OU8_5)
Scenario 6	S6	~49m (between S6 and Tank OU8_6)
Scenario 7	S6	~52m (between S6 and Tank OU7_7)
Scenario 8	S6	~57m (between S6 and Tank OU7_8)
Scenario 9	S7, A11 – A14	~90m (between A12 and Tank OU8_9)
Scenario 10	A11 – A14	~92m (between A12 and Tank OU8_10)
Scenario 11	A11 – A14	~91m (between A12 and Tank OU9_11)
Scenario 12	A11 – A14	~93m (between A13 and Tank OU9_12)
Scenario 13	A11 – A14	~92m (between A14 and Tank OU8_13)
Scenario 14	A11 – A14	~92m (between A14 and Tank OU9_14)
Scenario 15	A11 – A14	~93m (between A14 and Tank OU9_15)

2.4.19 The locations of the identified odour sources, details of the derivation of emission rates and a summary of the emission inventory are given in **Annex 2.4**.

Proposed Mitigation Measures

2.4.20 First of all, all rooms with potential odour generation will be enclosed and provided with mechanical ventilation. The exhaust will be installed at location farthest away from proposed residential development which is air sensitive in nature. The deodorization units would consist of Electrostatic Precipitator and Nano-Confined Catalytic Oxidation (NCCO) unit for the removal of oil and odour from the exhausted air. The photo of the deodorization unit is shown in **Annex 2.5**. The mitigation efficiency of 87.5% for the removal of odour has been assumed for the odour removal system and accounted in the derivation of emission rates. Supporting information of the removal efficiency will be provided in the detailed design stage as only preliminary design is available at this stage. In this case, two different scenarios (unmitigated scenario and mitigated scenario with 87.5% removal efficiency) would be assessed in the model. In detailed design of the project, the deodorization units will be optimised such as by adding extra filters in series to further improve the odour removal efficiency as practicably achievable to ensure that the odour impact in future can be minimised and within the acceptable limit. In addition, commissioning testing will be conducted before the operation of the Relocated Soy Sauce Factory after the deodorization units are installed. Odour samplings will be collected at the inlet and outlet of the odour removal systems to determine the targeted odour removal efficiency. If it is verified in the commissioning test that the targeted odour removal efficiency could not be achieved, a revised odour impact assessment based on the actual performance of the odour removal systems shall be conducted to support that adverse odour impact is not anticipated on the nearby ASRs. In addition, regular monitoring of the odour removal efficiency during operation stage may also be

conducted to ensure the targeted odour removal efficiency could be achievable if necessary. Odour samples shall be collected in every month at the inlet and outlet of the odor removal systems. If there is a failure of the odour removal systems to achieve the target odour removal efficiency during the regular monitoring, the factory shall investigate the problem, clean the odour removal systems and conduct maintenance/replacement the odour removal systems if necessary and consider if the operation process shall be ceased or the exhaust points shall be closed for the kitchen, fermentation room and wastewater treatment plant until the odour removal systems is resumed normal. Moreover, if odour complaint is received, odour patrol will be conducted at the relevant ASR and the site boundary of the factory. Remedial actions shall be taken to rectify the odour problem if it is confirmed to be related to the operation of the factory.

Sha Po Sewage Pumping Station

2.4.21 Sha Po Sewage Pumping Station (SPSPS) is located close to the Relocated Soy Sauce Factory at the east direction as shown in **Figure 2.1**. According to the onsite surveys conducted in June 2022 and July 2022, no adverse odour impacts were identified at the Sha Po Sewage Pumping Station. However, as a more conservative approach, the cumulative odour impact from SPSPS would be considered. Since the reply from DSD about the parameters of SPSPS for the use of odour impact assessment cannot be obtained, the Preliminary Environmental Review Section of the Final Report for Agreement No. CE 10/2020 (CE) Site Formation and Infrastructure Works for Proposed Public Housing Developments at Sha Po, Shap Pat Heung and Tai Kei Leng, Yuen Long - Feasibility Study (PER Section) and the approved EIA report for Sai O Trunk Sewer Sewage Pumping Station (Register No.: AEIAR-230/2021) (Approved EIA Report) are referred. As refer to the PER Section, the ADWF capacity of the upgraded Sha Po Sewage Pumping Station is 16,750 m^3/day. Therefore, the assumptions of the proposed Sai O Trunk Sewer Sewage Pumping Station (SPS) are adopted as with similar ADWF capacity (20,600m^3/day) by referring to the Approved EIA Report. As the ADWF capacity of Sai O Trunk Sewer SPS is slightly higher than the upgraded Sha Po SPS, underestimation of odour impact would not be anticipated. Moreover, the majority of the sewage collected by the Sha Po SPS and Sai O Trunk Sewer SPS both are from the surrounding residential developments and village houses. Although freshwater is being supplied as flushing water in the area near SPSPS and salted water is being supplied as flushing water in the area near Sai Oi Trunk Sewer SPS, flushing water would only contribute a small portion of the sewage and the majority of the sewage generated should be from kitchen and bathing. Therefore, it is anticipated that the effect on the amount of odour generated from the sewage by using different types of flushing water should not be significant. As such, the usage of the assumptions of the proposed Sai O Trunk Sewer Sewage Pumping Station are considered as appropriate. According to the observations during the additional onsite survey conducted in February 2024, the emission height and the dimension of the exhaust louvre of the SPSPS were assumed. The details of the assumptions of SPSPS are given in **Annex 2.4** and the photo records of the onsite surveys are provided in **Annex 2.9**.

Criteria and Conversion Factor

2.4.22 With the reference to EIAO-TM, the criteria is 5OUs on an averaging time of 5 seconds. Therefore, the modelling result of 1 hour average is converted to 5 seconds average using the below **Table 2.4** in accordance with the EPD's Guidelines on Choice of Models and Model Parameters (revised on 31st January 2024):

Table 2.4 Conversion Factor from 1 Hour to 5 Seconds

Source Type [1]	Stability Category [2]	1-hour to 5-sec Conversion Factor
Area	A, B, C, & D	2.5
	E & F	2.3
Line	A to F	6
Tall wake-free point	A, B & C	17
	D, E & F	35
Wake-affected Point	A to F	2.3
Volume	A to F	2.3

Notes:
[1] Source Types – Area and Waked-affected Point are adopted in the models.
[2] Stability Category are extracted from the PATH v3.0 released by EPD on 31st January 2024.

2.5 Assessment Results

2.5.1 The predicted air quality concentrations from the surrounding odour emissions have been quantitatively assessed for odour.

Odour

2.5.2 The predicted results of odour impact for all selected ASRs at all levels for fifteen scenarios are summarized in **Annex 2.6**.

2.5.3 Under the unmitigated scenarios, the predicted cumulative odour impact of all ASRs under the fifteen scenarios would comply with the criterion. Mitigation measures would be proposed in order to reduce the potential odour impact on the ASRs.

2.5.4 Under the mitigated scenarios, the predicted cumulative odour impact of all the ASRs under the fifteen scenarios would comply with the criterion. According to the predicted results, all predicted results of the ASRs are well below the criterion, with the maximum predicted results of 0.7 OU/m^3 at S4 and S5.

2.5.5 Since some of the emission sources are located at higher level, an additional test has been conducted for some additional test points (T01 to T09) for different levels (1.5mAG to 110.5mAG) in order to capture the worst-hit level for the potential odour impact at the surrounding locations, although no air sensitivity receivers are located at those locations. The locations of the additional test points and the predicted results for the additional test are shown in **Annex 2.10**. As shown by the results, the highest predicted result would be at T2 at 24.7mAG. Therefore, the worst hit level for the contour plots of each scenario is determined as 24.7mAG. The contour plots of the cumulative odour impact of Scenario 1 to Scenario 15 during the mitigated scenario (assessment heights: 1.5m above ground and 24.7m above ground) are shown in **Annex 2.7**.

2.5.6 With the proposed mitigation measures, the predicted cumulative odour impact of all the ASRs under the fifteen scenarios would comply with and well below the criterion (all of the predicted results of the ASRs under each scenario would be below 1 OU/m^3). Hence, adverse odour impact would not be anticipated. It reveals that odour of all mitigated scenarios could comply with the criterion for all representative ASRs.

2.6 A Summary of Air Pollution Control Measures

Air Pollution Control Measures

2.6.1 First of all, all rooms with potential odour generation including fermentation room & kitchen, wastewater treatment plant will be enclosed and provided with mechanical ventilation. The exhaust will be installed at location farthest away from proposed residential development which is air sensitive in nature. Various control measures are proposed. **Table 2.5** below summarizes the identified emission sources and the corresponding air pollution control measures to be implemented at the Relocated Soy Sauce Factory.

Table 2.5 Air Pollution Control Measures to be Implemented at the Relocated Soy Sauce Factory

Emission Sources	Air Pollution Control Measures
Fermentation Room & Kitchen	• 4 sets of odour removal system with 87.5% of removal efficiency will be adopted for removing the odour in the exhausted air.
Outdoor Sun-drying Area	• The concrete tanks will be covered with transparent plastic pane except collecting bean paste. • Under existing and future scenario, only 1 concrete tank at a time will be opened for collecting bean paste. "Not more than 3 concrete tanks at a time" to be opened for collection of bean paste has been adopted in this assessment to present a very conservative scenario.
Wastewater Treatment Plant	• 1 set of odour removal system with 87.5% of removal efficiency will be adopted for removing the odour in the exhausted air.

2.6.2 With proper implementation of mitigation measures recommended, significant odour impact on existing air sensitive uses and the proposed development would not be anticipated. The odour removal system will be optimised in detailed design stage of the project to ensure that the odour impact is minimised and within the acceptable limit.

3. CONCLUSION

3.1.1 The potential odour impact induced by the Relocated Soy Sauce Factory upon the surrounding sensitive receivers is assessed in this report. The odour strength in this assessment under reasonably worst possible scenario has been derived based on odour samples collected at the existing factory and future mechanical ventilation system design with odour removal facilities incorporated. It is understood that some of the soy sauce manufacturing operations might generate odour which include mainly cooking and 1st fermentation operation indoors, and outdoor sun-drying operation from concrete tanks. Besides, emission from future wastewater treatment plant was also accounted for in fifteen scenarios for different locations assumed for the three concrete tanks to be opened simultaneously during collecting bean paste under the mitigated and unmitigated scenarios have been conducted to model the worst scenario for the proposed Air Sensitive Receivers (ASRs) and the existing and planned ASRs within the 500m assessment area from the Relocated Soy Sauce Factory.

3.1.2 According to the assessment result, the maximum predicted odour concentration is 5-second average 0.7 OU/m^3 and is well below the standard of 5-second average 5 OU/m^3. Overall, the potential odour impact is considered acceptable based on the proposed design with some potentially odorous operation housed indoor (such as fermentation room, kitchen and wastewater treatment plant) and ventilated by mechanical ventilation system, and mitigation measures in terms of odour removal system with 87.5% odour removal efficiency connected with the mechanical exhaust for Fermentation Room, Kitchen and Wastewater Treatment Plant to be incorporated into the Relocated Soy Sauce Factory and the concrete tanks covered with transparent plastic pane except collecting bean paste & "not more than 3 concrete tanks at a time" to be opened for collection of bean paste.

3.1.3 It is noted that under rezoning application (No. Y/YL-NSW/9), the Relocated Soy Sauce Factory falls within an area proposed to be zoned "Residential (Group E)" ("R(E)"). The Relocated Soy Sauce Factory which is classified as an industrial use is proposed to be under Column 2 of the proposed R(E) zone. It means that such industrial use is NOT always permitted and a S16 planning application is required to justify the acceptability (including from environmental perspective) of the use after approval of the rezoning application. Moreover, the S16 application can be approved with conditions by the Town Planning Board so that applicant would be required to, say, re-assess and implement any measure to the satisfaction of relevant government departments in later detailed design stage. Further investigation, assessment, testing and commissioning, regular monitoring, etc. can be assured based on these mechanisms under the Town Planning S16 Application process.

3.1.4 In this assessment, the odour samples were collected under weather condition with ambient temperature of around 30°C. Generally, the odour strength would increase with the temperature so that higher odour strength is possible during hotter days. While the predicted maximum odour concentration in this assessment is well below the standard so that odour impact at hotter days may likely be acceptable, the Applicant will conduct another round of odour sampling exercise to capture and assess the odour emission strength under higher temperature conditions and reflect it in S16 application submissions to ensure that adequately worst representative condition can be covered. Moreover, in the Relocated Soy Sauce Factory, all rooms with potential odour generation including fermentation room & kitchen, wastewater treatment plant will be enclosed and provided with mechanical ventilation. The exhaust will be installed at location farthest away from proposed residential development which is air sensitive in nature. The Relocated Soy Sauce Factory is proposed with the odour removal facilities which is expected to achieve 87.5%

removal efficiency. Supporting information of the removal efficiency will be provided in the later stage as only preliminary design is available at this stage. With the recommended provisions, it is envisaged that the proposed ASRs in the proposed development, and existing and planned ASRs in the surrounding would be acceptable in odour terms. In addition, commissioning testing will be conducted before the operation of the Relocated Soy Sauce Factory after the deodorization units are installed if necessary. Odour samplings will be collected at the inlet and outlet of the odour removal systems to determine the targeted odour removal efficiency. If it is verified in the commissioning test that the targeted odour removal efficiency could not be achieved, a revised odour impact assessment based on the actual performance of the odour removal systems shall be conducted to support that adverse odour impact is not anticipated on the nearby ASRs. In addition, regular monitoring of the odour removal efficiency during operation stage may also be conducted to ensure the targeted odour removal efficiency could be achievable as required under the S16 planning approval condition, if imposed. Odour samples shall be collected in every month at the inlet and outlet of the odour removal systems. If there is a failure of the odour removal systems to achieve the target odour removal efficiency during the regular monitoring, the factory shall investigate the problem, clean the odour removal systems and conduct maintenance/replacement the odour removal systems if necessary and consider if the operation process shall be ceased or the exhaust points shall be closed for the kitchen, fermentation room and wastewater treatment plant until the odour removal systems is resumed normal. Moreover, if odour complaint is received, odour patrol will be conducted at the relevant ASR and the site boundary of the factory. Remedial actions shall be taken to rectify the odour problem if it is confirmed to be related to the operation of the factory.

3.1.5 In conclusion, with the recommended environmental mitigation measures implemented, the predicted results demonstrate that the current rezoning application is technically feasible from odour perspective. The proposed Relocated Soy Sauce Factory belongs to industrial use and will be under column 2 of the proposed R(E) zone so that subsequent S16 planning application and the need to fulfil planning approval condition, if any, is required. If relevant Government Departments consider appropriate to review the design of the factory at subsequent detailed design and implementation stages, the Odour Impact Assessment can be further reviewed with further odour samples to be collected under different weather conditions and supplementary information of odour removal efficiency submitted to Government for review (e.g. under S16 planning application). Relevant proposed mitigation measures can also be reviewed (if necessary) accordingly. Therefore, it is considered that this assessment is capable to demonstrate the feasibility to meet the odour requirement in this early planning stage and there is proper mechanism so that more detailed design information and assessment will be submitted to relevant government departments for approval before the proposed Relocated Soy Sauce Factory can be implemented.

Annex 2.3 Summary of Odour Samplings and Odour Sampling Reports

Summary of Odour Samples Collected

Odour samples within the existing soy sauce factory were collected in three days (14 October 2022, 19 October 2023, 25 October 2023). The locations of those odour samples collected and adopted for the derivation of the emission rates of the odour sources of the odour impact assessment are shown in **Drawing 1** to **Drawing 4**.

For the locations of the odour samples collected for wastewater treatment plant are shown in **Drawing 1**. The odour sample (WS1) and the odour sample (WS2) were collected at the 1st aeration tank and the 2nd aeration tank of the wastewater treatment plant respectively.

For the locations of the odour samples collected at kitchen are shown in **Drawing 2**. Two sets of odour samples were collected. The odour sample (AS11a) and the odour sample (AS11b) were collected simultaneously at the exhaust fan outlet A of the kitchen and near wok A inside the kitchen respectively. During the odour samples were collected, only one wok (i.e. wok A) was used for cooking and only one exhaust fan was being operated and the windows/ doors/ openings were closed. The odour sample (AS12a) and the odour sample (AS12b) were collected simultaneously at the exhaust fan outlet B of the kitchen and near wok B inside the kitchen respectively. During the odour samples were collected, only one wok (i.e. wok B) was used for cooking and only one exhaust fan was being operated and the windows/ doors/ openings were closed.

For the locations of the odour samples collected at fermentation room are shown in **Drawing 3**. Two sets of odour samples were collected. The odour sample (AS13a) and the odour sample (AS13b) were collected simultaneously at the exhaust fan outlet A of the fermentation room and inside the fermentation room respectively. During the odour samples were collected, only one exhaust fan was being operated and the windows/ doors/ openings were closed. The odour sample (AS14a) and the odour sample (AS14b) were collected simultaneously at the exhaust fan outlet A of the fermentation room and inside the fermentation room respectively. During the odour samples were collected, only one exhaust fan was being operated and the windows/ doors/ openings were closed.

For the locations of the odour samples collected at outdoor sun-drying area are shown in **Drawing 4**. Two sets of odour samples were collected. One set (AS23 and AS24) was collected at the eastern outdoor sun-drying aera. The odour sample (AS23) was collected at the cover of one of the concrete tank. The odour sample (AS24) was collected on the bean paste inside the concrete tank after the soy sauce was extracted. One set (AS25 and AS26) was collected at the western outdoor sun-drying area. The odour sample (AS25) was collected at the cover of one of the concrete tank. The odour sample (AS26) was collected on the bean paste inside the concrete tank after the soy sauce was extracted.

The Specific Odour Emission Rates (SOERs) and the measured odour concentration together with other information of the above samples collected are summarized as below. The details information of the odour samples collected can be referred to the odour sampling reports in **Annex 2.3**.

Table 1 Summary of SOERs of Samples Collected

Location ID	Sampling Location	Source	Temperature, ^{o}C	Sampling Device	SOER, $OU/m^2/s$
WS1	1st Aeration Tank of Wastewater Treatment Plant	Wastewater Surface	29.9	Flux Chamber with Vacuum Chamber	0.0139
WS2	2nd Aeration Tank of Wastewater Treatment Plant	Wastewater Surface	29.7	Flux Chamber with Vacuum Chamber	0.0075
AS23	Concrete Tank at Outdoor Sun-drying Area	Concrete Tank's Cover	32.8	Flux Chamber with Vacuum Chamber	0.045
AS24	Concrete Tank at Outdoor Sun-drying Area	Bean Paste inside Concrete Tank	32.3	Flux Chamber with Vacuum Chamber	0.710
AS25	Concrete Tank at Outdoor Sun-drying Area	Concrete Tank's Cover	35.6	Flux Chamber with Vacuum Chamber	0.056
AS26	Concrete Tank at Outdoor Sun-drying Area	Bean Paste inside Concrete Tank	35.7	Flux Chamber with Vacuum Chamber	0.820

Table 2 Summary of Odour Concentrations of Samples Collected

COMMENTS

Eight (8) odour samples were collected by ALS Technichem (HK) staff on 14th October 2022 at a soy sauce plant near Kam Sheung Road. Collected samples were then sent back to ALS odour laboratory for olfactometry analysis.

NOTES

This is the Final Report and supersedes any preliminary report with this batch number.

The results related only to the items tested. All pages of this report have been checked and approved for release.

Fung Lim Chee, Richard
Managing Director

This report may not be reproduced except with prior written approval from ALS Technichem (HK) Pty Ltd.

1. SUMMARY OF WORK

Eight (8) locations were selected by the client for the sampling of odour at a soy sauce plant. Six (6) odour samples were collected from ambient air and exhaust sources. Two (2) were collected from the water surface of two wastewater treatment tanks by using a Flux Chamber device. Odour samples were then delivered to ALS Hong Kong laboratory for Olfactometry Analysis.

2. SAMPLING SUMMARY

2.1 Odour Sampling by using vacuum chamber for ambient air source

Figure 1a: Sampling Bag & Air-tightened Sampler

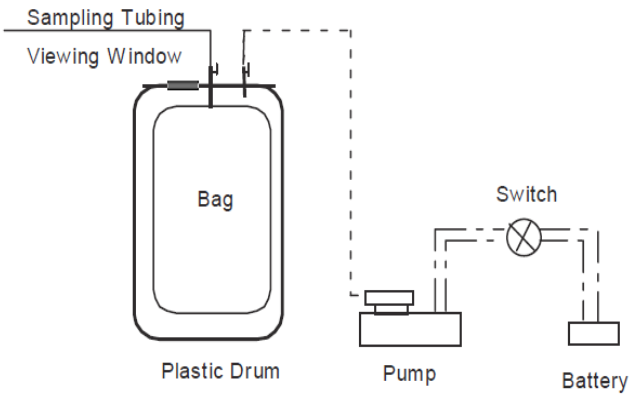

Figure 1b: Schematic Diagram of Sampling Device

Odour gas sample for ambient air was collected by using the passive sampling technique. A Nalophan™ sampling bag was placed inside an air-tight sampler which was drawn to vacuum by using a sampling pump. Approximately 40 litres of gas sample was collected into the sampling bag for testing. Diagram of the passive sampling equipment that was used was shown in Figure 1.

2.2 Odour Sampling by using vacuum chamber / Flux Hood Chamber on water surface source

A flux hood chamber (Figure 2) was placed on the odour emission surface of the sampling location. A stream of odour-free nitrogen gas, at a flow of 6 L/min, was introduced into the flux hood to simulate wind blowing on the surface of the sampling location.

Odour gas sample was collected by using passive sampling technique. A Nalophan bag was placed inside an air-tightened sampler (Figure 1a) and then drawn to vacuum (Figure 1b). Approximately 40 Litres of gas sample was collected into the sampling bag for testing. The *specific odour emission rate* (SOER) was determined by the air flow through the hood and the odour concentration of the exit air.

Figure 2: Dynamic Flux hood used for Odour sampling

2.3 Olfactometry Analysis

Odour concentration was determined by a Forced-choice Dynamic Olfactometer in accordance with the European Standard Method (EN13725:2002).

This European Standard specifies a method for the objective determination of the odour concentration of a gaseous sample using dynamic olfactometry with human assessors.

This European Standard is applicable to the measurement of odour concentration of pure substances, defined mixtures and undefined mixtures of gaseous odorants in air or nitrogen, using dynamic olfactometry with a panel of human assessors being the sensor.

The unit of measurement is the odour unit per cubic metre: ou_E/m^3. The odour concentration was measured by determining the dilution factor required to reach the detection threshold. The odour concentration at the detection threshold was by the definition as 1 OU_E/m^3. The odour concentration was then expressed in terms of multiples of the detection threshold. The range of measurement including pre-dilution prior to the olfactometry analysis is typically from 10^1 ou_E/m^3 to 10^7 ou_E $/m^3$.

Olfactometry analysis was performed by using the Scentroid™ SS6000 Olfactometer. The testing was performed by at least five qualified panellists who have been selected through an n-butanol screening test.

The SOER at each area source is calculated by the following equation:

$$SOER\left(\frac{OU_E}{m^2 s}\right) = \frac{Odour\ Concentration\ (OU_E/m^3) \times Air\ Flow\ Rate\ Inside\ Hood\ (m^3/s)}{Covered\ Water\ Surface\ Area\ (m^2)}$$

where:

Air Sweep Rate Inside Hood for Flux Chamber = 0.0001 m^3/s
Covered Water Surface for Flux Chamber = 0.155 m^2

All samples were analysed within 24 hours after sampling.

During sampling, following items were also recorded:

- ambient temperature;
- relative humidity;
- wind speed; and
- wind direction
- photos showing the sampling locations

COMMENTS

Eight (8) odour samples were collected by ALS Technichem (HK) staff on 19th October 2023 at a soy sauce plant in Yuen Long. Collected samples were sent back to ALS odour laboratory for olfactometry analysis.

NOTES

This is the Final Report and supersedes any preliminary report with this batch number.

The results related only to the items tested. All pages of this report have been checked and approved for release.

Chan Wai Hung, Mannix
Laboratory Manager - Project

This report may not be reproduced except with prior written approval from ALS Technichem (HK) Pty Ltd.

1. SUMMARY OF WORK

Eight (8) samples were collected at selected locations for the analysis of odour at a soy sauce plant. Flus chamber method was adopted for four (4) of the samples over the Soybean Aging Tank. Detailed sampling information and conditions were shown in the Table of Section 3. Odour samples were delivered back to ALS Hong Kong laboratory for Olfactometry Analysis within 24 hours.

2. SAMPLING SUMMARY

2.1 Odour Sampling by using vacuum chamber for ambient air source

Figure 1a: Sampling Bag & Air-tightened Sampler

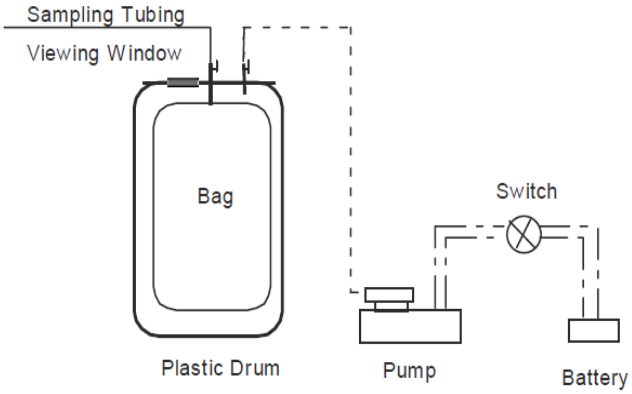

Figure 1b: Schematic Diagram of Sampling Device

Odour gas sample for ambient air source was collected by using the passive sampling technique. A Nalophan™ sampling bag was placed inside an air-tight sampler which was drawn to vacuum by using a sampling pump. Approximately 40 litres of gas sample was collected into the sampling bag for testing. Diagram of the passive sampling equipment that was used was shown in Figure 1.

2.2 Odour Sampling by using vacuum chamber / Flux Hood Chamber from area source

A flux hood chamber (Figure 2) was placed on the odour emission surface of the sampling location. A stream of odour-free nitrogen gas, at a flow of 6 L/min, was introduced into the flux hood to simulate wind blowing on the surface of the sampling location.

Odour gas sample was collected by using passive sampling technique. A Nalophan bag was placed inside an air-tightened sampler (Figure 1a) and then drawn to vacuum (Figure 1b). Approximately 40 Litres of gas sample was collected into the sampling bag for testing. The *specific odour emission rate* (SOER) was determined by the air flow through the hood and the odour concentration of the exit air.

Figure 2: Dynamic Flux hood used for Odour sampling

2.3 Olfactometry Analysis

Odour concentration was determined by a Forced-choice Dynamic Olfactometer in accordance with the European Standard Method (BS EN13725:2022).

This European Standard specifies a method for the objective determination of the odour concentration of a gaseous sample using dynamic olfactometry with human assessors.

This European Standard is applicable to the measurement of odour concentration of pure substances, defined mixtures and undefined mixtures of gaseous odorants in air or nitrogen, using dynamic olfactometry with a panel of human assessors being the sensor.

The unit of measurement is the odour unit per cubic metre: ou_E/m^3. The odour concentration was measured by determining the dilution factor required to reach the detection threshold. The odour concentration at the detection threshold was by the definition as 1 OU_E/m^3. The odour concentration was then expressed in terms of multiples of the detection threshold. The range of measurement including pre-dilution prior to the olfactometry analysis is typically from 10^1 ou_E/m^3 to 10^5 ou_E/m^3.
Olfactometry analysis was performed by using the Olfasense TO9 Olfactometer. The testing was performed by at least five qualified panellists who have been selected through an n-butanol screening test.

The specific odour emission rate (SOER) was determined by the air flow through the hood and the odour concentration of the exit air.

The SOER at each area source is calculated by the following equation:

$$SOER\ \left(\frac{OU_E}{m^2 s}\right) = \frac{Odour\ Concentration\ (OU_E/m^3) \times Air\ Flow\ Rate\ Inside\ Hood\ (m^3/s)}{Covered\ Water\ Surface\ Area\ (m^2)}$$

where:

Air Sweep Rate Inside Hood for Flux Chamber = 0.0001 m^3/s
Covered Water Surface for Flux Chamber = 0.155 m^2

All samples were analysed within 24 hours after sampling.

During sampling, following items were also recorded:

- Ambient temperature;
- Relative humidity;
- Wind speed; and
- Wind direction
- Photos showing the sampling locations

ANALYSIS KOON CHUN SAUCE FACTORY, YUEN LONG	(BLANK)	(1)

Four (4) odour samples were collected by ALS Technichem (HK) staff on 25th October 2023 at a soy sauce plant in Yuen Long. Collected samples were sent back to ALS odour laboratory for olfactometry analysis.

This is the Final Report and supersedes any preliminary report with this batch number.

The results related only to the items tested. All pages of this report have been checked and approved for release.

This report may not be reproduced except with prior written approval from ALS Technichem (HK) Pty Ltd.

1. SUMMARY OF WORK

Four (4) odour samples were collected at selected locations by the client for the sampling of odour at a soy sauce plant. Two (2) odour samples were collected at each location over the soybean aging tank by using a Flux Chamber device with two different sampling conditions. Detailed information was shown in the Table of Section 3. Odour samples were delivered to ALS Hong Kong laboratory for Olfactometry Analysis.

2. SAMPLING SUMMARY

2.1 Odour Sampling by using vacuum chamber for ambient air source

Figure 1a: Sampling Bag & Air-tightened Sampler

Figure 1b: Schematic Diagram of Sampling Device

Odour gas sample for ambient air was collected by using the passive sampling technique. A Nalophan™ sampling bag was placed inside an air-tight sampler which was drawn to vacuum by using a sampling pump. Approximately 40 litres of gas sample was collected into the sampling bag for testing. Diagram of the passive sampling equipment that was used was shown in Figure 1.

2.2 Odour Sampling by using vacuum chamber / Flux Hood Chamber from area source

A flux hood chamber (Figure 2) was placed on the odour emission surface of the sampling location. A stream of odour-free nitrogen gas, at a flow of 6 L/min, was introduced into the flux hood to simulate wind blowing on the surface of the sampling location.

Odour gas sample was collected by using passive sampling technique. A Nalophan bag was placed inside an air-tightened sampler (Figure 1a) and then drawn to vacuum (Figure 1b). Approximately 40 Litres of gas sample was collected into the sampling bag for testing. The *specific odour emission rate* (SOER) was determined by the air flow through the hood and the odour concentration of the exit air.

Figure 2: Dynamic Flux hood used for Odour sampling

2.3 Olfactometry Analysis

Odour concentration was determined by a Forced-choice Dynamic Olfactometer in accordance with the European Standard Method (BS EN13725:2022).

This European Standard specifies a method for the objective determination of the odour concentration of a gaseous sample using dynamic olfactometry with human assessors.

This European Standard is applicable to the measurement of odour concentration of pure substances, defined mixtures and undefined mixtures of gaseous odorants in air or nitrogen, using dynamic olfactometry with a panel of human assessors being the sensor.

The unit of measurement is the odour unit per cubic metre: ou_E/m^3. The odour concentration was measured by determining the dilution factor required to reach the detection threshold. The odour concentration at the detection threshold was by the definition as 1 OU_E/m^3. The odour concentration was then expressed in terms of multiples of the detection threshold. The range of measurement including pre-dilution prior to the olfactometry analysis is typically from 10^1 ou_E/m^3 to 10^5 ou_E/m^3.

Olfactometry analysis was performed by using the Olfasense TO9 Olfactometer. The testing was performed by at least five qualified panellists who have been selected through an n-butanol screening test.

The specific odour emission rate (SOER) was determined by the air flow through the hood and the odour concentration of the exit air.

The SOER at each area source is calculated by the following equation:

$$SOER\left(\frac{OU_E}{m^2 s}\right) = \frac{Odour\ Concentration\ (OU_E/m^3) \times Air\ Flow\ Rate\ Inside\ Hood\ (m^3/s)}{Covered\ Water\ Surface\ Area\ (m^2)}$$

where:

Air Sweep Rate Inside Hood for Flux Chamber = 0.0001 m^3/s
Covered Water Surface for Flux Chamber = 0.155 m^2

All samples were analysed within 24 hours after sampling.

During sampling, following items were also recorded:

- Ambient temperature;
- Relative humidity;
- Wind speed; and
- Wind direction
- Photos showing the sampling locations

Annex 2.4 Locations of Identified Odour Sources, Derivation of Emission Rates and Input Parameters of Odour Source in AERMOD

Summary of Specific Odour Emission Rates (SOERs) of Samples Collected

Locations of Odour Samples Collected	SOER, $OU/m^2/s$		Maximum SOER Adopted
1st Aeration Tank (Wastewater Treatment Plant)	WS1	-	0.0139
	0.0139	-	
2nd Aeration Tank (Wastewater Treatment Plant)	WS2	-	0.0075
	0.0075	-	
Outdoor Sun-drying Area	AS23	AS25	0.056
	0.045	0.056	
Rectangular Fermentation Tank with Cover Removed	AS24	AS26	0.820
	0.710	0.820	

Summary of Odour Concentrations of Samples Collected

Locations of Odour Samples Collected	Odour Concentration, OU/m^3		Maximum Odour Concentration Adopted
Kitchen (at Exhaust Fan) [1]	AS11a	AS12a	2698
	2060	2268	
Kitchen (Inside Kitchen) [1]	AS11b	AS12b	
	1964	2698	
Fermentation Room (at Exhaust Fan) [2]	AS13a	AS14a	238
	205	238	
Fermentation Room (Inside Kitchen) [2]	AS13b	AS14b	
	215	204	

Notes:

[1] Odour samples were collected simultaneously inside the kitchen and at the exhaust fan of the kitchen. Only one exhaust fan was being operated and the windows/ doors/ openings were closed (i.e. the air was extracted to the outdoor via the exhaust fan only) while the odour samples were being collected. Therefore, the exhaust fan is the only emission point while the odour sample was being collected.

[2] Odour samples were collected simultaneously inside the fermentation room and at the exhaust fan of the fermentation room. Only one exhaust fan was being operated and the windows/ doors/ openings were closed (i.e. the air was extracted to the outdoor via the exhaust fan only) while the odour samples were being collected. Therefore, the exhaust fan is the only emission point while the odour sample was being collected.

Calculation of Emission Rates of Odour Sources

Wastewater Treatment Plant (OU5)		
Location ID during Sampling	WS1+WS2	[1]
Odour Concentration during sampling of 1st Aeration Tank	0.0139	$OU/m^2/s$
Odour Concentration during sampling of 2nd Aeration Tank	0.0075	$OU/m^2/s$

Notes:
[1] "-" means "Not Applicable"
[2] The Release Height, Exit Temperature, Flowrate and Area of the odour sources, OU1 to OU5 are provided by the Project E&M Consultant. The Internal Diameter is calculated by the area of exhaust, which is provided by the Project E&M Consultant. The Exit Velocity is calculated by using the area of exhaust and flowrate which are provided by the Project E&M Consultant.
[3] % of Removal Efficiency is provided by the manufacturer of the deodorisation unit.
[4] Number of operation hours is provided by the representative of the existing soy sauce factory. The odour sources named as OU1_d to OU4_d would include the odour emissions from kitchen and fermentation room. The odour sources named as OU1_n to OU4_n would include the odour emission from fermentation room only as there would be no operation in kitchen during 1800 to 0800.

Calculation of Odour Emission - Scenario 2

Notes:
[1] "-" means "Not Applicable"
[2] The Release Height, Exit Temperature, Flowrate and Area of the odour sources, OU1 to OU5 are provided by the Project E&M Consultant. The Internal Diameter is calculated by the area of exhaust, which is provided by the Project E&M Consultant. The Exit Velocity is calculated by using the area of exhaust and flowrate which are provided by the Project E&M Consultant.
[3] % of Removal Efficiency is provided by the manufacturer of the deodorisation unit.
[4] Number of operation hours is provided by the representative of the existing soy sauce factory. The odour sources named as OU1_d to OU4_d would include the odour emissions from kitchen and fermentation room. The odour sources named as OU1_n to OU4_n would include the odour emission from fermentation room only as there would be no operation in kitchen during 1800 to 0800.

Notes:
[1] "-" means "Not Applicable"
[2] The Release Height, Exit Temperature, Flowrate and Area of the odour sources, OU1 to OU5 are provided by the Project E&M Consultant. The Internal Diameter is calculated by the area of exhaust, which is provided by the Project E&M Consultant. The Exit Velocity is calculated by using the area of exhaust and flowrate which are provided by the Project E&M Consultant.
[3] % of Removal Efficiency is provided by the manufacturer of the deodorisation unit.
[4] Number of operation hours is provided by the representative of the existing soy sauce factory. The odour sources named as OU1_d to OU4_d would include the odour emissions from kitchen and fermentation room. The odour sources named as OU1_n to OU4_n would include the odour emission from fermentation room only as there would be no operation in kitchen during 1800 to 0800.

Notes:
[1] "-" means "Not Applicable"
[2] The Release Height, Exit Temperature, Flowrate and Area of the odour sources, OU1 to OU5 are provided by the Project E&M Consultant. The Internal Diameter is calculated by the area of exhaust, which is provided by the Project E&M Consultant. The Exit Velocity is calculated by using the area of exhaust and flowrate which are provided by the Project E&M Consultant.
[3] % of Removal Efficiency is provided by the manufacturer of the deodorisation unit.
[4] Number of operation hours is provided by the representative of the existing soy sauce factory. The odour sources named as OU1_d to OU4_d would include the odour emissions from kitchen and fermentation room. The odour sources named as OU1_n to OU4_n would include the odour emission from fermentation room only as there would be no operation in kitchen during 1800 to 0800.

Notes:
[1] "-" means "Not Applicable"
[2] The Release Height, Exit Temperature, Flowrate and Area of the odour sources, OU1 to OU5 are provided by the Project E&M Consultant. The Internal Diameter is calculated by the area of exhaust, which is provided by the Project E&M Consultant. The Exit Velocity is calculated by using the area of exhaust and flowrate which are provided by the Project E&M Consultant.
[3] % of Removal Efficiency is provided by the manufacturer of the deodorisation unit.
[4] Number of operation hours is provided by the representative of the existing soy sauce factory. The odour sources named as OU1_d to OU4_d would include the odour emissions from kitchen and fermentation room. The odour sources named as OU1_n to OU4_n would include the odour emission from fermentation room only as there would be no operation in kitchen during 1800 to 0800.

Calculation of Odour Emission - Scenario 15

Notes:
[1] "-" means "Not Applicable"
[2] The Release Height, Exit Temperature, Flowrate and Area of the odour sources, OU1 to OU5 are provided by the Project E&M Consultant. The Internal Diameter is calculated by the area of exhaust, which is provided by the Project E&M Consultant. The Exit Velocity is calculated by using the area of exhaust and flowrate which are provided by the Project E&M Consultant.
[3] % of Removal Efficiency is provided by the manufacturer of the deodorisation unit.
[4] Number of operation hours is provided by the representative of the existing soy sauce factory. The odour sources named as OU1_d to OU4_d would include the odour emissions from kitchen and fermentation room. The odour sources named as OU1_n to OU4_n would include the odour emission from fermentation room only as there would be no operation in kitchen during 1800 to 0800.

Odour Emission Source of Sha Po Sewage Pumping Station

Odour Source ID	Description	Source Type	x-coordinate	y-coordinate	Ground Level	Release Height [1]	Exit Temperature [2]	Exhaust Diameter [3]	Exit Velocity [2]	Mitigated Odour Emission Rate (Reference Case) [2]	Removal Efficiency (Reference Case) [2]	Removal Efficiency (Sha Po Sewage Pumping Station) [4]	Mitigated Odour Emission Rate (Correted with 99% Removal Efficiency)
					(mPD)	(mAG)	(K)	(m)	(m/s)	(ou/s)	%	%	(ou/s)
SPS1	Exhaust of Sha Po Sewage Pumping Station	Point	823458.2	835155.7	3.7	5.9	298	1.24	1.67	272.5	90%	99%	27.25

Notes:

[1] According to the observation during onsite survey, the Release Height is assumed as ~9.6mPD (i.e. 5.9mAG).

[2] As refer to the Preliminary Environmental Review Section of the Final Report for Agreement No. CE 10/2020 (CE) Site Formation and Infrastructure Works for Proposed Public Housing Developments at Sha Po, Shap Pat Heung and Tai Kei Leng, Yuen Long - Feasibility Study, the ADWF capacity of the upgraded Sha Po Sewage Pumping Station is 16,750 m^3/day. Therefore, the assumptions of the proposed Sai O Trunk Sewer Sewage Pumping Station are adopted as with similar ADWF capacity (20,600m^3/day) by referring to the approved EIA report for Sai O Trunk Sewer Sewage Pumping Station (Register No.: AEIAR-230/2021). As the ADWF capacity of Sai O Trunk Sewer SPS is slightly higher than the upgraded Sha Po SPS, underestimation of odour impact would not be anticipated. Moreover, the majority of the sewage collected by the Sha Po SPS and Sai O Trunk Sewer SPS both are from the surrounding residential developments and village houses. Although freshwater is being supplied as flushing water in the area near SPSPS and salted water is being supplied as flushing water in the area near Sai Oi Trunk Sewer SPS, flushing water would only contribute a small portion of the sewage and the majority of the sewage generated should be from kitchen and bathing. Therefore, it is anticipated that the effect on the amount of odour generated from the sewage by using different types of flushing water should not be significant. As such, the usage of the assumptions of the proposed Sai O Trunk Sewer Sewage Pumping Station are considered as appropriate.

[3] According to the observation during onsite survey, the dimensions of the exhuast are assumed as 1.1m (width) x 1.1m (length). Therefore, the Exhaust Diameter is calculated by: $(((1.1x1.1)/\pi)^{1/2})x2 = 1.24m$.

[4] As refer to the Preliminary Environmental Review Section of the Final Report for Agreement No. CE 10/2020 (CE) Site Formation and Infrastructure Works for Proposed Public Housing Developments at Sha Po, Shap Pat Heung and Tai Kei Leng, Yuen Long - Feasibility Study, the % of Removal Efficiency is 99% as provided by DSD.

Annex 2.9 Photo Records of Onsite Survey for SPSPS

Photo Records of Onsite Survey for SPSPS

Additional onsite survey has been conducted on 28 February 2024. According to the observation during the onsite survey, the emission height of the exhaust louvre identified is about 5.9 mAG and the dimensions of the exhaust louvre is about 1.1m (width) x 1.1m (width). Please refer the details shown in the photos below:

Dear Sir / Madam,

Land Contamination Assessment Study for Section 12A Planning Application for Proposed Amendments to the Nam Sang Wai Outline Zoning Plan from "I(D)" and "OS" Zones to "R(E)" Zone at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D.107 and Adjoining Government Land, West of Castle Peak Road - Tam Mi, Yuen Long - Enquiry for Land Contamination Information

We are conducting a Land Contamination Assessment Study for Section 12A Planning Application for Proposed Amendments to the Nam Sang Wai Outline Zoning Plan from "I(D)" and "OS" Zones to "R(E)" Zone at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D.107 and Adjoining Government Land, West of Castle Peak Road - Tam Mi, Yuen Long. As required by the "Practice Guide for Investigation and Remediation of Contaminated Land" published by the Environmental Protection Department of the Government of HKSAR (EPD), information pertaining to the change of land uses/past activities/incidents/accidents at the Application Site are required as part of the vetting process.

Of particular interests is whether there are any registered chemical waste producers under your record in the Application Site, any waste disposal record, any accidental spillage record, any submission relating to land contamination assessment and any information you could provide which might be useful for our study. We enclosed herewith a site map showing the location of the Application Site for your reference.

Due to the urgency of the project, we would be much appreciated if you could provide the requested information by **18 July 2022**.

Should you have any queries, please do not hesitate to contact the undersigned at 3465 2811 (email: cchiu@ramboll.com) or our Mr. Peter Leung at 3465 2831 (email: peterleung@ramboll.com). We sincerely seek your feedback on this matter. Thank you in advance for any assistance you can provide.

Yours faithfully,
For and on behalf of
Ramboll Hong Kong Limited

(Attn.: Calvin CHIU)

Dear Calvin CHIU,

Land Contamination Assessment Study for Section 12A Planning Application for Proposed Amendments to the Nam Sang Wai Outline Zoning Plan from "I(D)" Zone and "OS" Zones to "R(E)" Zone at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D. 107 and Adjoining Government Land, West of Castle Peak Road – Tam Mi, Yuen Long - Enquiry for Land Contamination Information

We refer to your above letter under reference requesting for information for Land Contamination Assessment.

Regarding chemical spillage / incident record, this Regional Office has no record of chemical spillage / leakage incident at the captioned locations in the past 3 years. For waste disposal records and submission relating to land contamination, this Regional Office does not keep this information. You may need to check with other relevant parties / departments for such information as appropriate.

For the records of Chemical Waste Producer Registration, a registry of chemical waste producers is available in our Territory Control Office. Should you like to view the records, you may approach Mr. Eric FUNG at 2835 1027 for making an appointment to view the records.

Yours faithfully,

(TSE Yuet-chuen)
for Director of Environmental Protection

1. INTRODUCTION

1.1 Background

1.1.1 AECOM Asia Company Limited (AECOM) has been commissioned to carry out engineering studies to support Section 12A Planning Application for Proposed Amendments to the Approved Nam Sang Wai Outline Zoning Plan from "I(D)" and "OS" Zones to "R(E)" Zone, Yuen Long, New Territories.

1.1.2 The Application Site occupies an area of approximately 81,550m^2. The Application Site is bounded by Pok Wai South Road and Kam Tin River to the west and Castle Peak Road – Tam Mi Section to the east. The detailed location is shown in **Figure 1**.

1.1.3 The Application Site including area currently zoned as "Industrial (Group D) (I(D))" and part of "open storage (OS)" under the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8, which is proposed to rezone as "Residential (Group E) (R(E))" hereafter "R(E)" Site. The remaining part of "OS" site is proposed to rezone as "R(E)" to use for relocation of soy sauce factory which currently located in "I(D)" hereafter "I(D)" Site.

1.1.4 Another area currently zoned as "Other Specified Uses (Comprehensive Development to include Wetland Restoration Area)" ("OU(CDWRA)") located to the north of the Application Site is proposed to be rezoned into "OU(CDWRA)1" zone for private residential development under separate submission. In order to assess the combined impact of the "R(E)" and "OU(CDWRA)1" sites, the proposed parameters of both sites are included under this assessment to present the holistic picture.

1.1.5 The DIA report serves as a supportive document for application under Section 12A of Town Planning Ordinance (Cap 131).

1.2 Objective of this Submission

1.2.1 This report outlines the assessment results of the potential drainage impacts generated by the Proposed Development of the Application Site. The main objectives of this assessment include the followings:

(i) Review available existing drainage studies in the vicinity of the Application Site.

(ii) Review the existing drainage condition and flooding susceptibility of the Application Site.

(iii) Outline the methodology adopted in this assessment.

(iv) Outline changes to the drainage characteristics and potential drainage impacts which may arise from the Proposed Development, and

(v) Propose drainage mitigation measures where appropriate to mitigate the potential drainage impact.

2. DEVELOPMENT PROPOSAL

2.1 The Proposed Development

2.1.1 The "R(E)" Site has an area of approximately 46,501m^2 for residential use with a domestic Gross Floor Area (GFA) at about 115,942m^2. The development is anticipated to complete with population intake in 2031.

2.1.2 The Master Layout Plan (MLP) of the Application Site is shown in **Figure 2**. The details of the proposed development schedule are summarized in **Table 1** below.

Table 1 Development Schedule for "R(E)" Site (subject application)

"R(E)" Application Site Area	About 81,550 m^2
Primary School Site Area	About 6,200 m^2
Relocated Soy Factory Site Area	About 27,459 m^2
Government land currently occupied by some temporary structures	About 1,390 m^2
"R(E)" Residential Site Area (1)	About 46,501m^2
"R(E)" Domestic GFA	About 115,942 m^2

Note:

(1) Excluding portion of Government land currently occupied by some temporary structures at the western portion of the Application Site with an area of about 1,390m^2

Table 2 Development Schedule for "OU(CDWRA)1" Site (under separate submission)

"OU(CDWRA)1" Site Area	About 116,231 m^2
"OU(CDWRA)1" Site Domestic GFA	About 255,708 m^2
Proposed Wetland Restoration Area (i.e. Detention Pond)	About 28,000 m^2

3. ASSESSMENT METHODOLOGY AND ASSUMPTION

3.1 Overview of Methodology

3.1.1 This DIA is carried out in accordance with the requirements of "Advice Note No. 1 – Application of the Drainage Impact Assessment Process to Private Sector Projects" and Stormwater Drainage Manual (SDM) 5th Edition, the Corrigendum No. 1/2022 and Corrigendum No. 1/2024 promulgated by Drainage Services Department (DSD).

3.1.2 Potential drainage impact of the Proposed Development is assessed quantitatively. Catchments based runoff will be estimated based on Rational Method while the hydraulic performance of the drains shall adopt Colebrook-White equation with appropriate roughness factors correspond to the materials and deteriorating conditions as summarized in **Table 3**.

Table 3 Summary of Design parameters

	Proposed Box Culvert / Detention Pond	Proposed U-channel
Design Standard	1 in 200-year storm event	1 in 50-year storm event
Rainfall Zone	Hong Kong Observatory (HKO) Headquarters	
Design Storm Parameters	a = 508.8; b = 3.46; c = 0.322;	a = 505.5; b = 3.29; c = 0.355;
Rainfall Intensity	$i = \frac{a}{(t_d + b)^c}$	
Peak Runoff Estimation	Rational Method	
Runoff Coefficient	0.95 for paved area and 0.35 for unpaved area	
Pipe Sediment	10% reduction in flow area	
Pipe roughness (ks)	ks = 0.15mm for precast concrete pipes in normal condition n = 0.014 for concrete-lined channel in good condition	
Climate Change	16% 12.1% (Additional Design Allowance)	

4. DRAINAGE SYSTEMS OF THE APPLICATION SITE

4.1 Site Description

4.1.1 The Application Site of R(E) Site area of about 81,550m^2, consists of the residential site (includes the Government land currently occupied by some temporary structures at the western portion), the relocated soy sauce factory and the primary school site.

4.1.2 The existing topography across the Application Site varies in height, ranging from approximately +4.1 to +5.1 mPD.

4.2 Existing Drainage System

4.2.1 According to DSD drainage record plan, available topographic survey, an existing 3m wide open channel is located along the northern edge outside the Application Site. This channel collects surface runoff from "I(D)" Site, "OU(CDWRA)" site, and an external catchment located on the west side of the "I(D)" Site (denoted as "Catchment 1"). The stormwater collected in the concrete open channel flows from east to west, connecting to the north side of the Historical Kam Tin River.

4.2.2 On the north side of the Historical Kam Tin River, an outfall structure discharges towards the Trained Kam Tin River via three 900mm pipes (denoted as "Outfall 1").

4.2.3 On the south side of the Historical Kam Tin River, an outfall structure discharges towards the Trained Kam Tin River via a twin cell 5.25m(W) × 3.84m(H) Box Culvert (denoted as "Outfall 2").

4.2.4 The upstream of the twin cell 5.25m(W) × 3.84m(H) box culvert mentioned in Section 4.2.3 is connected by open drainage channel transitions and another twin cell 5.25m(W) × 3.84m(H) box culvert. Part of the open drainage channel transitions and the twin cell 5.25m(W) × 3.84m(H) Box Culvert are overlapping the "OS" Site.

4.2.5 Other than two main discharge flow, the runoff from a small catchment located between "I(D)" Site and "OS" Site is collected by existing gullies and is directly discharged to Historical Kam Tin River.

4.2.6 The existing drainage network and catchment areas is shown in **Figure 3**.

4.2.7 The current operating Soy Sauce Factory adopted on-site sewage treatment plant to process their wastewater, with a valid discharge license allowing discharge of treated effluent up to 50m^3/day, to the nearest stormwater outlet of Kam Tin River.

4.3 Impact on Existing Drainage System

4.3.1 The existing site is about 86% paved including 90% of "OS" Site, soy sauce factory site and 14% unpaved area including Catchment 1, Government land currently occupied by some temporary structures and 10% of "OS" Site. The application proposed to rezone existing "I(D)/OS" to "Residential (R(E))". Under current master layout plan, approximately 30% of the development area will be converted to unpaved green area, while school site and soy sauce factory site are assumed to be 100% paved.

4.3.2 The Application Site under Planning Application No. Y/YL-NSW/9 and other private development to the north (Planning Application No. Y/YL-NSW/8) have an additional surface runoff discharging to the existing concrete open channel in pre-development scenario. According to DIA report under Planning Application No. Y/YL-NSW/8, the existing open channel would be replaced by a box culvert. The proposed box culvert would provide drainage capacity no less than the existing open channel, while the future discharge from Y/YL-NSW/8 would be reduced after completion of the proposed detention pond. Details are summarized in **Table 4**.The surface runoff estimation for detention pond refers to **Appendix F1**.

4.3.3 The stormwater from relocated soy sauce factory and proposed school site will discharge to Outfall 2 located at the southern part of the site. Due to increase in unpaved area and reduction in catchment area, the peak runoff to Outfall 2 will change from 3.53m^3/s to 3.12m^3/s. As such, the proposed development will discharge less stormwater to Outfall 2 compared to the existing condition. The peak runoff under post development is presented in **Table 5** and hydraulic calculation is provided in **Appendix F2.**

Table 4 Change in Surface Runoff Estimation for Detention Pond

		Paved (m^2)	Unpaved (m^2)	Pond (m^2)	Rainfall Intensity (mm/hr)	Total surface runoff (m^3/s)
Discharge to Proposed Box Culvert Replacing Existing 3m Concrete Open Channel (Outfall 1)						
Pre-Development Catchment	"OU(CDWRA)" (Refer to Figure 3)	6,045	91,514	1,373	99.02	1.08 (a)
	"I(D)"	29,629	-	-	99.02	0.77 (b)
	Catchment 1	190	5,257	-	99.02	0.07 (c)
					Sub-total (a) + (b) + (c)	**1.92 (d)**
Post-Development Catchment	"OU(CDWRA)1" (Refer to Figure 4)	61,762	34,869	19,600	99.02	2.49 (e)
	"R(E)"	29,296	12,555	-	99.02	0.89 (f)
					Runoff stored in proposed detention pond:	1.47 (g)
					Sub-total (e) + (f) – (g)	**1.91 (h)**
					Discharge to Proposed Box Culvert (from "OU(CDWRA)1" Site) (e) – (g):	1.02
					Net Decrease to Proposed Box Culvert (d) – (h):	**0.01**

Note:

Assume 5% paved and 95% unpaved area for "OU(CDWRA)" site (Pre-development)

Assume 100% paved area for "I(D)" site (Pre-development)

Assume 100% unpaved area for Catchment 1 (Pre-development)

Assume 70% paved 30% unpaved area for post development scenario

Assume 100% paved area for primary school and soy sauce factory sites (Post-development)

Assume concrete channel and connected Historical Kam Tin River work as one storage system

16% (due to climate change) +12.1% (additional design allowance) for climate change has been considered

Grey colored area under separate submission

Table 5 Post Development Runoff Discharge

	Paved (m^2)	Unpaved (m^2)	Pond (m^2)	Rainfall Intensity (mm/hr)	Total surface runoff (m^3/s)
Discharge to Detention Pond					
"OU(CDWRA)1" Site Area 2 & Detention Pond (Refer to Appendix F2)	31,874	10,060	19,600	316.13	4.69
Discharge to Proposed Box Culvert Replacing Existing 3m Concrete Open Channel (Outfall 1)					
"OU(CDWRA)1" Site Area 1 & Site Area 3 (Refer to Appendix F2)	29,888	24,809	-	316.13	3.25
"R(E)"	29,296	12,555	-	316.13	2.83
Discharge to 2 Cells 5.25m x 3.84m Box Culvert (Outfall 2)					
"R(E)"	36,914	1,395	-	316.13	**3.12**

Note:
Assume 70% paved 30% unpaved area for post development scenario
Assume 100% paved area for primary school and soy sauce factory sites (Post-development)
Assume concrete channel and connected Historical Kam Tin River work as one storage system
16% (due to climate change) +12.1% (additional design allowance) for climate change has been considered
Grey colored area under separate submission

5. PROPOSED DRAINAGE SYSTEM

5.1 Perimeter Drains

5.1.1 Perimeter drains are proposed to intercept surface runoff generated from the development site. Runoff collected by perimeter drains will be discharged via terminal manholes.

5.1.2 The internal catchments division for u-channel is shown in **Figure 5**. The runoff estimation for u-channel refers to **Appendix F4** and hydraulic calculation refers to **Appendix F5**.

5.2 Discharge to Proposed Box Culvert

5.2.1 90% of the generated runoff from "R(E)" residential site collected by perimeter drains and internal drainage system. Under post-development stage, the peak discharge 2.83m^3/s of stormwater runoff will be collected and conveyed to stormwater terminal manholes, new stormwater discharge pipes proposed at the downstream of terminal manholes to be connected to reserved stormwater connection of the proposed box culvert replacing the existing 3m concrete open channel. The proposed box culvert is located at "OU(CDWRA)1" site. Details of the proposed box culvert refer to "OU(CDWRA)1" site DIA report under Planning Application No. Y/YL-NSW/8. The proposed box culvert discharges to Historical Kam Tin River and eventually discharge to Trained Kam Tin River via existing 3x900mm pipes (Outfall 1).

5.2.2 According to **Appendix F2**, the peak discharge to existing 3m concrete open channel from R(E)" Site under pre-development is 2.65m^3/s. There is an increase of 0.18m^3/s runoff to the proposed box culvert due to "R(E)" Site. To allow the increased runoff from "R(E)" Site to discharge to proposed box culvert and keep the drainage capacity of the proposed box culvert no less than the existing open channel, the future discharge from "OU(CDWRA)1" site would be reduced after completion of the proposed detention pond. The detail of detention pond in "OU(CDWRA)1" site and amount of runoff from "OU(CDWRA)1" site discharge to proposed box culvert are under separate submission.

5.2.3 According to hydraulic checking in **Appendix F2**, the total runoff discharge to the proposed box culvert under post-development is 6.08m^3/s which is reduced by 0.01m^3/s from pre-development condition (6.09m^3/s), therefore no drainage impact is envisaged.

5.3 Discharge to Outfall Structure

5.3.1 It is proposed that the surface runoff from remaining 10% of "R(E)" residential site and school site discharge to the existing channel located west side of the site boundary, eventually to Outfall 2 structure located south of the site boundary. The peak discharge about 0.83m^3/s is further discharged from Outfall 2 structure towards Trained Kam Tin River.

5.3.2 The stormwater from relocated soy sauce factory and proposed school site will be discharge to existing drainage outfall structure at southern boundary. About 2.29m^3/s and 0.52m^3/s surface runoff from relocated soy sauce factory and proposed school site respectively will be collected through perimeter drains and internal drainage system and then deliver to Outfall 2 structure.

5.3.3 The total runoff discharge to Outfall 2 structure after the development will reduce from 3.53m^3/s to 3.12m^3/s. Therefore, no drainage impact is envisaged.

5.3.4 The proposed stormwater drainage arrangement is shown in **Figure 4**. The preliminary hydraulic checking is shown in **Appendix F2**.

5.3.5 The size and detailed arrangement of the internal drainage system and perimeter drain proposed for the development will be further reviewed in detailed design stage, submission will be made to Buildings Department for approval in due course.

5.4 Proposed Extension of Existing Twin Cell Box Culvert

5.4.1 As mentioned in Section 4.2.4, a section of existing open channel is located under the rezoned "RE" Site. To facilitate soy sauce factory operation purpose, the existing twin cell 5.25m(W) × 3.84m(H) Box Culvert be extended to the rezoned "RE" Site boundary, total extension length is about 15m. Proposed maintenance responsibility refers to Section 6. Details will be discussed in detail design stage.

6. MAINTENANCE RESPONSIBILITY

6.1 Proposed Terminal Manhole and Proposed Pipeline

6.1.1 The Applicant will be responsible for the maintenance of the stormwater drainage facilities within the site boundary. The detailed maintenance responsibility of proposed drainage facilities outside the Application Site will require further discussion with relevant government departments for confirmation during detailed design stage.

6.1.2 For the proposed pipeline and connections downstream of the development stormwater terminal manhole, the development is responsible for the cost of construction.

6.2 Proposed Extension of Existing Twin Cell Box Culvert

6.2.1 Extension of existing twin cell box culvert is proposed in Section 5.4.1.The proposed extension work will simplify the maintenance responsibility. Existing upstream box culvert under castle peak road will remain under Highways Department's operation and maintenance, the old and extended section of box culvert within private lot zoned "RE" will be maintained by the private development. Finally, the downstream open channel, which is shortened after the culvert extension, will remain be maintained by Drainage Service Department.

7. CONCLUSIONS

7.1.1 As the "OU(CDWRA)1" and "R(E)" sites are located immediately adjacent to each other, the combined impact of both sites are evaluated under this assessment to present the holistic picture.

7.1.2 The drainage impact due to the change of drainage characteristics (i.e. change in surface runoff due to increase in unpaved area) have been assessed. Climate change is considered in accordance with Stormwater Drainage Manual. Upon completion of the proposed development, reduction in drainage discharge to Kam Tin River is anticipated.

7.1.3 It is proposed that the stormwater surface runoff to be collected by internal drainage pipe network as well as perimeter drains along the site perimeter. The proposed drainage system discharges a portion of surface runoff to the proposed box culvert. The proposed box culvert discharges to Historical Kam Tin River and eventually discharge to Trained Kam Tin River via existing 3x900mm pipes (Outfall 1).

7.1.4 The remaining portion of surface runoff discharge to the existing outfall structure. The net discharge flow to the outfall structure will be decreased and dischagred to the Trained Kam Tin River via existing twin cells 5.25m(W)×3.84m(H) box culvert (Outfall 2).

7.1.5 Based on the hydraulic assessment, there is no adverse drainage impact to the surrounding drainage system arising from the Proposed Development.

Pre-Development Note:
(1) Assume approximately 85% of pre-development site area (98,932m^2) runoff discharge to the existing open channel.
(2) Assume 5% paved and 95% unpaved area for pre-development runoff discharge to the existing open channel.
(3) Assume 100% paved for I(D) site
(4) Assume 100% unpaved for catchment 1 site

Post-Development Note:
(5) Assume 70% paved 30% unpaved area
(6) Assume 70% pond 30% pond walkway area
(7) Assume 70% paved area and 30% unpaved area

General Note:
(8) Grey colored area under separate submission.

APPENDIX F2

Surface Runoff Estimation for Pre and Post-Development

Rainfall Return Period : 1 in 200

Return Period	200-year		
Rainfall Intensity i =	$\frac{a}{(t_d + b)^c}$		SDM Table 3a

Pre-Development Note:
(1) Assume approximately 85% of pre-development site area (98,933m^2) runoff discharge to the existing open channel.
(2) Assume approximately 15% of pre-development site area (17,299m^2) runoff discharge to the pond outside site boundary.
(3) Assume 5% paved and 95% unpaved area for pre-development runoff discharge to the existing open channel.
(4) Assume 100% paved for I(D) site
(5) Assume 100% unpaved for cathcment 1 site
(6) Assume 90% paved 10% unpaved area for OS site

General Note:
(12) Grey colored area under separate submission.

Post-Development Note:
(7) Assume 70% paved area and 30% unpaved area
(8) Assume 70% pond 30% pond walkway area
(9) Assume 100% paved area for primary school and soy sauce factory sites.
(10) Measured area direct discharge to Kam Tin River is 5,521m^2; assumed 70% paved area and 30% unpaved area .
(11) The total area of OU site discharge to proposed box culvert refers to Annex F3

APPENDIX F3

Annex F3 10/30/2024

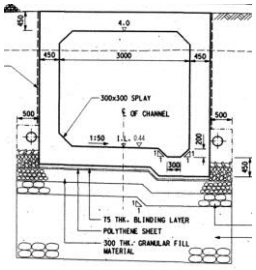
Hydraulic Check for Proposed Box Culvert

Post-development

The capacity of the box culvert is calculated by Manning Equation:

$$V = \frac{R^{1/6}}{n} \times \sqrt{RS_f}$$

where	V =	velocity of the pipe flow	m/s	
	S_f =	Box Culvert gradient	m/m	
	=	0.001		(1 in 1000)
	n =	Manning coefficient		SDM Table 13
	=	0.014	$s/m^{1/3}$	Concrete-lined Channel under good condition
	W =	Width of Box Culvert		
	=	**3000**	mm	
	=	3	m	
	D =	Depth of Box Culvert		
	=	**3560**	mm	DSD As-built Record refers
	=	3.56	m	
	P =	Wetted Parameter		500mm freeboard is included for 3.56m depth box culvert, 3.06m is considered for depth in the wetted parameter calculation
		9.12	m	
	A =	Cross Section Area of Box Culvert after 10% siltation considered		
		9.612	m^2	
	R =	Hydraulic Radius		
	=	$\frac{A}{P}$		
	=	1.05		
	V =	2.33	m/s	
	Available Capacity Q_a =	V x A		
	=	22.43	m^3/s	



Peak runoff discharge from the Proposed Development including "OU(CDWRA)1" Site and "R(E)" Site

$^{\#}Q_p$ =	6.080	m^3/s	200-year

*Max. flow under 200B condition to proposed box culvert just before "OU(CDWRA)1" Site and "R(E)" Site discharge

Q_{exist} =	6.563	m^3/s	200-year
Q_a >	Q_p+Q_{exist}		
	12.643	m^3/s	
=>	**OK**		

Note

$^{\#}$Qp refers to DIA Section 4.3.2

*The max. flow under 200B condition is provided by DSD.

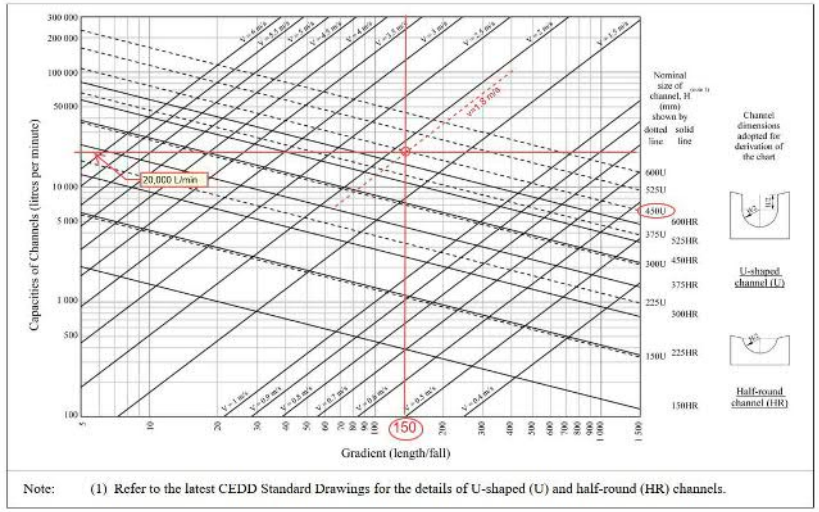
/	DP9	259	525	U	100	2.4	38,000	0.63	0.50	C1	79.37



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

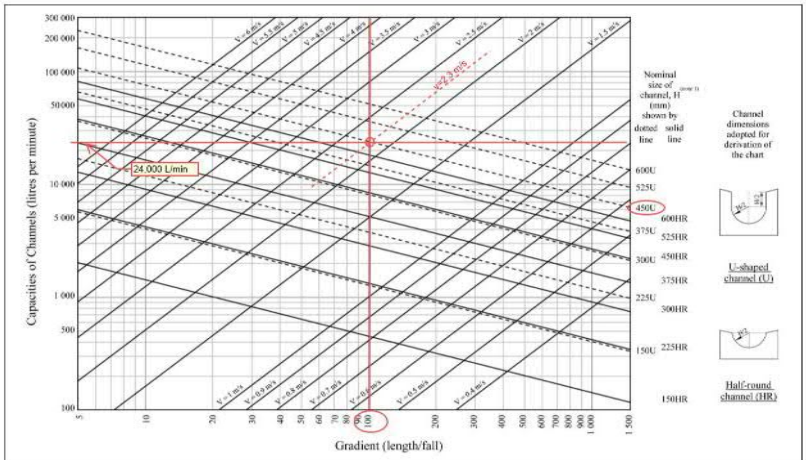
According to rapid design chart for U-shaped (U) and half-round (HR) channel

$$\text{Capacity Ultilization} = \frac{\text{Flow Rate}}{\text{Runoff Capacity}}$$

U-Shape channel design for Catchment A1:

1. Choose channel size =450U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 150
4. Read Runoff Capacity = 20,000 L/min

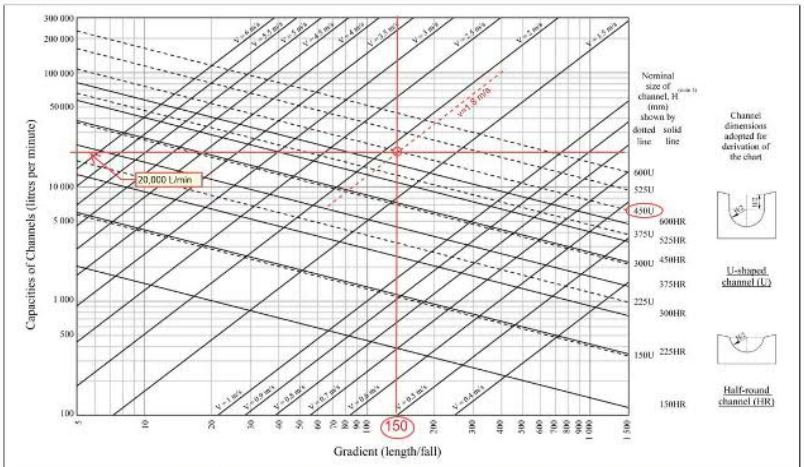
Appendix F5
Hydraulic Checking for U-channel



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment A2:

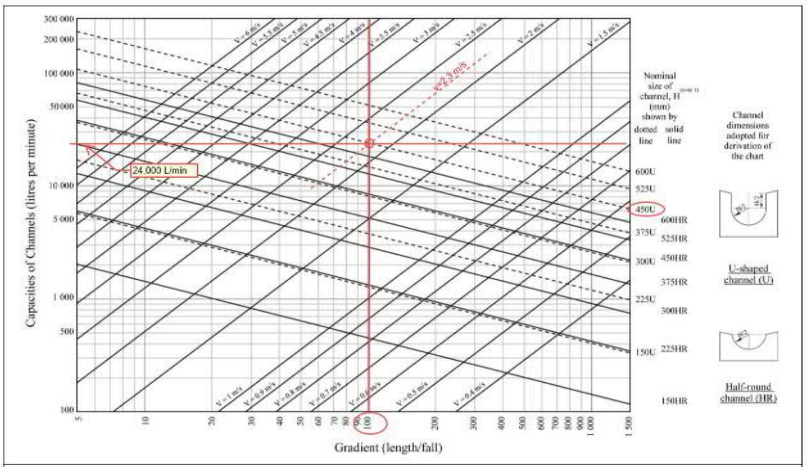
1. Choose channel size =450U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 24,000 L/min



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment A3:

1. Choose channel size =450U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 150
4. Read Runoff Capacity = 20,000 L/min

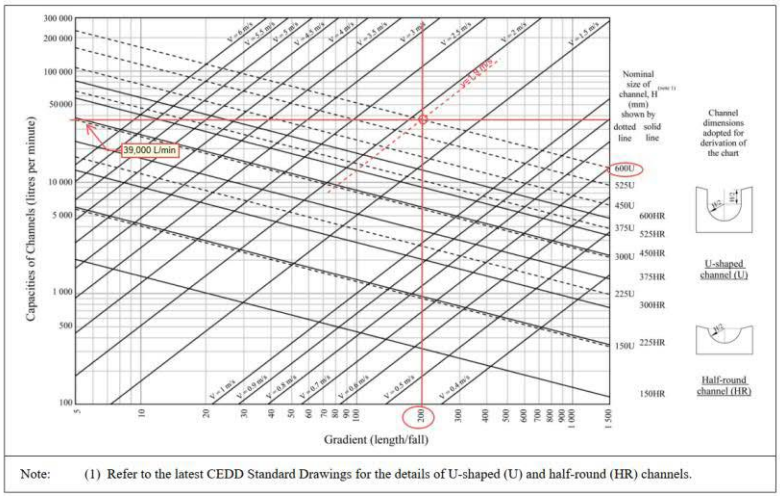


Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment B1:

1. Choose channel size =450U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 24,000 L/min

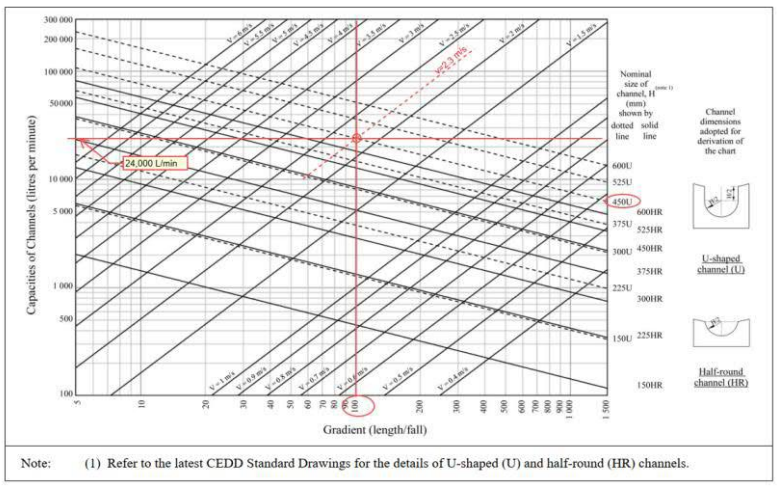
Appendix F5
Hydraulic Checking for U-channel



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment B2:

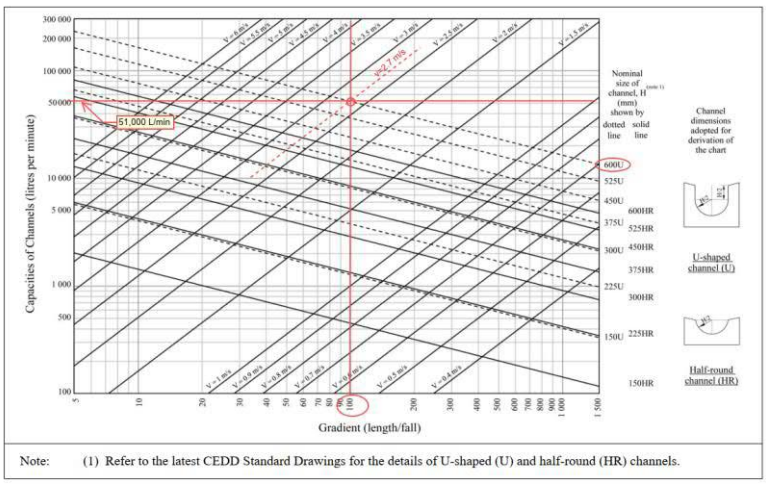
1. Choose channel size =600U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 200
4. Read Runoff Capacity = 39,000 L/min



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment B3:

1. Choose channel size =450U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 24,000 L/min

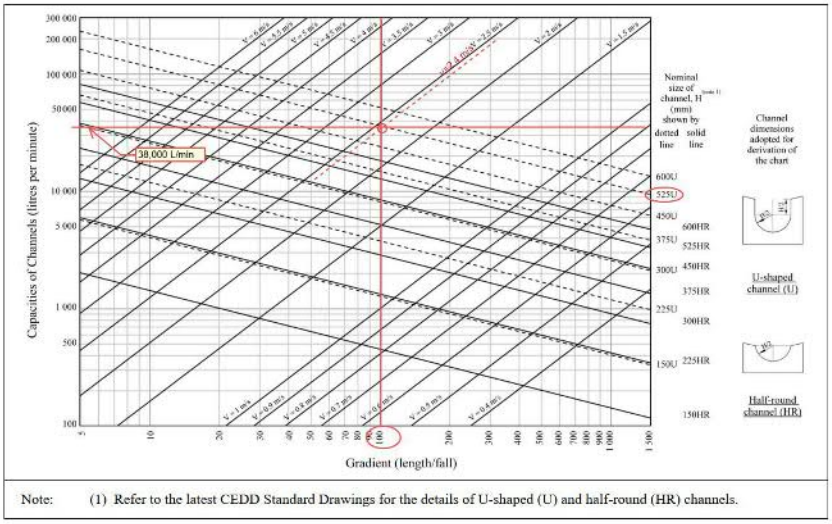


Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment B4:

1. Choose channel size =600U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 51,000 L/min

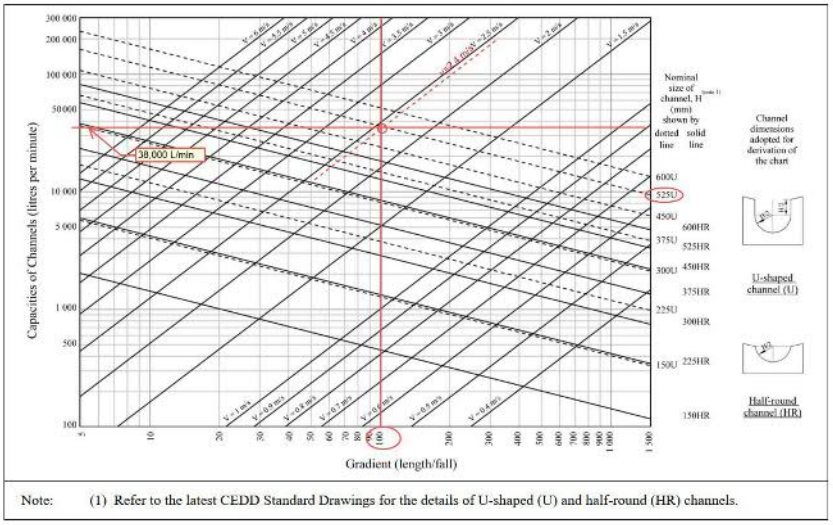
Appendix F5
Hydraulic Checking for U-channel



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment B5:

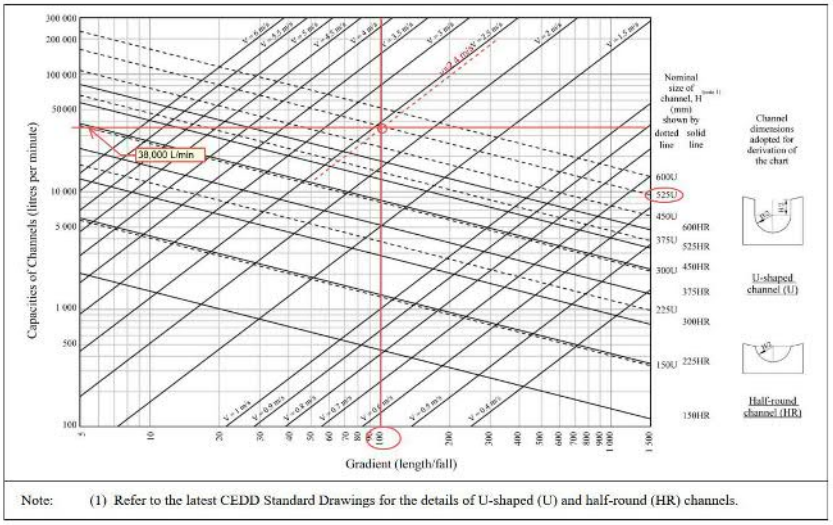
1. Choose channel size =525U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 38,000 L/min



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment B6:

1. Choose channel size =525U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 38,000 L/min



Note: (1) Refer to the latest CEDD Standard Drawings for the details of U-shaped (U) and half-round (HR) channels.

U-Shape channel design for Catchment C1:

1. Choose channel size =525U
2. Min velocity = 1 m/s
3. Read Gradient = 1 in 100
4. Read Runoff Capacity = 38,000 L/min

1. INTRODUCTION

1.1 Background

1.1.1 AECOM Asia Company Limited (AECOM) have been commissioned to carry out engineering studies to support Section 12A Planning Application for Proposed Amendments to the Approved Nam Sang Wai Outline Zoning Plan from "I(D)" and "OS" Zones to "R(E)" Zone, Yuen Long, New Territories.

1.1.2 The Application Site occupies an area of approximately 81,550m^2. The Application Site is bounded by Pok Wai South Road and Kam Tin River to the west and Castle Peak Road – Tam Mi Section to the east. The detailed location is shown in **Figure 1**.

1.1.3 The Application Site including area currently zoned as "Industrial (Group D) (I(D))" and part of "open storage (OS)" under the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8, which is proposed to rezone as "Residential (Group E) (R(E))" (hereafter "R(E)" Site). The remaining part of "OS" site is proposed to rezone as "R(E)" Site to use for relocation of soy sauce factory which currently located in "I(D)" site.

1.1.4 Another area currently zoned as "Other Specified Uses (Comprehensive Development to include Wetland Restoration Area)" ("OU(CDWRA)") located to the north of the Application Site is proposed to be rezoned into private residential area development and is submitted under separate submission (hereafter "OU(CDWRA)1" Site). In order to assess the combined impact of the "R(E)" sites and "OU(CDWRA)1", the proposed parameters of both sites are included under this assessment to present the holistic picture.

1.1.5 The SIA report serves as a supportive document for application under Section 12A of Town Planning Ordinance (Cap 131).

1.2 Previous Approved Sewerage Impact Assessment

1.2.1 A previous Section 12A application was approved in 2016. The application for amendment to the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8 involved rezoning of an "Open Storage"("OS") to "Commercial" ("C").

1.2.2 The Open Storage was entirely within current application with an area of 38,593m^2. According to previous indicative development proposal, the development consisted of commercial elements including shopping mall and a 700-room hotel development.

1.2.3 In previous approved SIA, discharge to public sewerage system at Sha Po Sewage Pumping Station (SPSPS) was proposed in ultimate disposal scheme. Downstream of SPSPS was connected to Nam Sang Wai Sewerage Pumping Station (NSWSPS). The extract of approved SIA for previous Section 12A application is shown in **Appendix 1**. This approved scheme (hereafter "2016 Scheme") will be referred for comparison to the current application.

1.3 **Objective of this Submission**

1.3.1 This report outlines the assessment results of the potential sewerage impacts generated by the Proposed Development at the Application Site. The main objectives of this assessment include the followings:

(i) Identify any potential impact on the current sewerage system due to the additional sewage discharge from the proposed development and the existing developments/ villages nearby;

(ii) Assessing impact to the existing sewerage conveyance system by the flow generated from the proposed development; and

(iii) Recommend mitigation measures for the identified sewerage impacts.

2. DEVELOPMENT PROPOSAL

2.1 The Proposed Development

2.1.1 The "R(E)" Site residential portion has an area of approximately 46,501m^2 with a domestic Gross Floor Area (GFA) at about 115,942m^2. The development is anticipated to complete with population intake in 2031.

2.1.2 The Master Layout Plan (MLP) of the Application Site is shown in **Figure 2**. The details of the proposed development schedule are summarized in **Table 1** and **2**. The comparison table of development schedule between 2016 Scheme and proposed scheme is shown in **Table 3** below.

Table 1 Development Schedule for the "R(E)" Site

(Application No. Y/YL-NSW/9)

"R(E)" Site Area	
"R(E)" Site Area	About 81,550m^2
Primary School Site Area	About 6,200m^2
Soy Sauce Factory Site Area	About 27,459m^2
"R(E)" Residential Site Area(1)	About 46,501m^2
3rd Parties Lots	About 1,390m^2
"R(E)" Site No. of Units	3,115 units
Person per Flat Ratio (PPoF) (2)	2.6
"R(E)" Site Residential Population	8,099

Table 2 Development Schedule for the "OU(CDWRA)1" Site (under separate application) (Application No. Y/YL-NSW/8)

"OU(CDWRA)1" Site (under separated submission)	
"OU(CDWRA)1" Site Area	About 116,231 m^2
"OU(CDWRA)1" Site Total GFA	About 255,708 m^2
GIC – Neighbourhood Elderly Centre (NEC)	About 722m^2
GIC – 100 places Residential Care Homes for the Elderly (RCHE)	About 5,400m^2
"OU(CDWRA)1" Site No. of Units	6,825 units
Person per Flat Ratio (PPoF) (2)	2.6
"OU(CDWRA)1" Site Residential Population	17,745

Notes:

(1) Excluding portion of Government land (3rd parties Lots) currently occupied by some temporary structures at the western portion of the Application Site with an area of about 1,390m^2

(2) Person-Per-Flat ratio (PPoF) of 2.6 with reference to the recommendation under HK2030+ (Oct 2021)

Table 3 Development Schedule Comparison

	2016 Scheme	Current Proposal
Site Area	About 38,593m^2 (excluding soy sauce factory and school site)	About 81,550m^2 (including residential zone, soy sauce factory and primary school site)
Proposed Usage	Shopping Mall and Hotel	Residential, Primary School and Relocated Soy Sauce Factory
Site Design Population	1,758	8,099

3. EXISTING SEWERAGE SYSTEM

3.1.1 According to DSD drainage record plan and available topographic survey, the upstream incoming flow to the existing public manhole FSH1001880 are rising mains and its downstream connecting to existing 1200mm dia. public sewers which are identified running north along Pok Wai South Road towards Nam Sang Wai Sewage Pumping Station (NSWSPS). The closest sewage connection manhole (FSH1001880) is about 100m away from the "OU(CDWRA)1" site boundary.

3.1.2 The Application Site is currently unsewered. In the vicinity, three nos. of sewage pumping stations, including SPSPS, NSWSPS and Kam Tin Sewage Pumping Station (KTSPS), including the associated gravity sewers / rising mains were completed and in operation serving Au Tau, Pat Heung, Sha Po and Nam Sang Wai area respectively.

3.1.3 The Application Site is currently unsewered. A soy sauce factory currently in operation adopted sequencing batch reactor (SBR) to treat wastewater, with a valid discharge license from EPD allowing discharge of treated effluent up to 50m^3/day, to the nearest stormwater outlet of Kam Tin River. The discharge license from EPD refers to **Appendix 6**.

3.1.4 NSWSPS is located at the northwest of the Application Site. NSWSPS has a design capacity of approximately 42,921m^3/day. Sewage collected by the NSWSPS will be discharged to the Yuen Long Sewage Treatment Works (YLSTW) for treatment and disposal.

3.1.5 A desktop land survey identified an existing twin rising mains (i.e. **Figure 3** refers) from SPSPS designed to convey raw sewage to NSWSPS is partially encroached to a private lot.

4. DESIGN ASSUMPTIONS AND CRITERIA

4.1 Unit Flow Factors

4.1.1 This SIA has been carried out following the assumptions and criteria set out in the "*EPD/TP1/05 Guidelines for Estimating Sewage Flows for Sewage Infrastructure Planning Version 1.0*" (GESF) published by Environmental Protection Department.

4.1.2 The unit flow factors adopted in the SIA are based on the unit flow factors in Table T-1 and Table T-2 of the GESF. A summary of the flow factors used for different development types is shown in **Table 4** below.

Table 4 Unit Flow Factors

Abbreviation	Development Type	Unit Flow Factor (m^3/head/day)
R2	Residential R2	0.27
Non F&B	Retail J4	0.28
F&B	Restaurants & Hotel J10	1.58
School	Student	0.04
	Teacher	0.28

4.2 Catchment Inflow Factors

4.2.1 The Catchment Inflow Factors (PCIF): Yuen Long = 1.00 is adopted in the SIA are based on the unit flow factors in Table 4 of the GESF.

4.3 Worker Density by Economic Activity and Planned Usage Type

4.3.1 This SIA has been carried out following the assumptions and criteria set out in the "*Commercial and Industrial Floor Space Utilization Survey*" conducted by the Planning Department in 2004/2005.

4.3.2 A density of 5.1 employees per 100 m^2 (for Restaurants - Private Commercials) GFA is adopted for retail food and beverage activities (F&B) and clubhouse F&B area.

4.3.3 A density of 2.1 employees per 100 m^2 (for Retail and Trade - Private Commercials) GFA is adopted for clubhouse non food and beverage activities (non F&B) area.

4.3.4 Assume 70% of clubhouse area is non-F&B and 30% of clubhouse area is F&B and assume 100% retail area is F&B for this assessment purposes only.

5. FLOW PROJECTION

5.1 Population Estimates

5.1.1 **Table 5** summarizes the population estimation for the Development – "R(E)" Site.

Table 5 Population Estimation for the Development – "R(E)" Site

Development Type	People Per Unit	Population
Residential Towers		
"R(E)" Site Residential Development	2.6	8,099
Commercial - F&B (Assume 100% F&B)		
Restaurants	5.1 employee per 100m²	148
Commercial - Kindergarten x 1		
Student (no.)	Note 4	160
Teacher (no.)	Note 4	20
Clubhouse (Assume 70% Non F&B and 30% F&B)		
Restaurants	5.1 employee per 100m²	54
Retail	2.1 employee per 100m²	52
	Total	**8,533**

Development Type	People Per Unit	Population
Primary School		
Student (no.)	Note 5	750
Teacher (no.)	Note 5	58

Note:

1. Person-Per-Flat ratio (PPoF) of 2.6 with reference to the recommendation under HK2030+ (Oct 2021)
2. Adopt Non F&B = 70% of Clubhouse Area and F&B = 30% of Clubhouse Area for assessment purposes only
3. Adopt F&B = 100% Retail Area for assessment purposes only
4. According to Education Bureau Key Statistics on kindergarten Pupil-Teacher Ratio of 8.1:1. The proposed kindergarten has 8 classrooms with an average class size of 20. One kindergarten is purposed for the Development.
5. According to Education Bureau Key Statistics on Primary School Pupil-Teacher Ratio of 13.0:1. The proposed primary school has 30 classrooms in total with an average class size of 25.
6. According to CIFSUS Table 8, the worker density for private commercials' retail trade is assumed as 2.1 workers per GFA (in 100 m^2)
7. According to CIFSUS Table 8, the worker density for private commercials' restaurants is assumed as 5.1 workers per GFA (in 100 m^2)

5.2 Sewage Estimates

5.2.1 **Table 6** summarizes the sewage flow generated from the Development – "R(E)" Site.

Table 6 Sewage Flow From the Development – "R(E)" Site

Development Type	Population/ Employment	Unit Flow Type (m^3/head/day)	Unit Flow Factor	ADWF (m^3/d)
Residential Towers				
"R(E)" Site Residential Development	8,099	Residential R2	0.27	2,186.73
Commercial - F&B				
Restaurants	148	F&B (J10)	1.58	233.84
Commercial - Kindergarten x 1				
Student (no.)	160	Student	0.04	6.40
Teacher (no.)	20	Employee	0.28	5.60
Clubhouse				
Restaurants	54	F&B (J10)	1.58	85.32
Retail	52	Non F&B (J4)	0.28	14.56

Development Type	Population/ Employment	Unit Flow Type (m^3/head/day)	Unit Flow Factor	ADWF (m^3/d)
Swimming Pool				
Outdoor Swimming Pool	-	-	-	5.13 (0.059L/s)
Indoor Swimming Pool	-	-	-	2.19 (0.025L/s)
Sub Total for "R(E)" Site Residential Development (Including swimming pool backwash)				**2,539.77m^3/d**
Primary School				
Student (no.)	750	School	0.04	30.00
Teacher (no.)	58	Employee	0.28	16.24
Relocated Soy Sauce Factory				
Treated Effluent	-	-	-	118

Note: 1. ADWF from Soy Sauce Factory refers to Appendix 7. Information is provided by Soy Sauce Factory.

2. A WPCO license for operation of the relocated soy sauce factory will be applied and obtained by the operator of relocated soy sauce factory.

5.2.2 **Table 7** summarizes the subtotal sewage flow generated from the Development – "R(E)" Site.

Table 7 Subtotal Sewage Flow from Development – "R(E)" Site (Application No. Y/YL-NSW/9)

Development Type	ADWF (m^3/d)
"R(E)" Site Residential Development (Excluding swimming pool backwash)	2,532.45
Swimming Pools Backwash	7.32
Primary School	46.24
Relocated Soy Sauce Factory	118
Total Sewage Flow of "R(E)" Site, Primary School and Relocated Soy Sauce Factory (under separate submission)	2,704.01

5.2.3 **Table 8** summarizes the subtotal sewage flow generated from the Development – "OU(CDWRA)1" Site.

Table 8 Subtotal Sewage Flow from Development – "OU(CDWRA)1" Site (under separate application)

Development Type	ADWF (m^3/d)
"OU(CDWRA)1" Site Residential Development (Excluding swimming pool backwash) (under separate submission)	5,245.03
Swimming Pools Backwash	14.64
GIC Facilities (under separate submission)	25.72
Sub Total of "OU(CDWRA)1" Site (Including swimming pool backwash) (under separate submission)	5,285.39

5.2.4 **Table 9** summarizes the subtotal sewage flow generated from the entire development.

Table 9 Total Sewage Flow from the Entire Development

Development Type	ADWF (m^3/d)
Discharge to NSW SPS	
Sub Total of "R(E)" Residential Site (Including swimming pool backwash)	2,539.77
Sub Total of "R(E)" Primary School Site	46.24
Sub Total of "R(E)" Relocated Soy Sauce Factory	118
Sub Total for "OU(CDWRA)1" Site (Including swimming pool backwash) (under separate submission)	5,285.39
Catchment Inflow Factor (CIF)	1.00
Combined Total Discharge from the "R(E)" Site and "OU(CDWRA)1" Site	**7,989.40 m^3/d**
Contributing Population	29,591
Peaking Factor	4
Combined Sub Total Peak Flow from "R(E)" Residential Site and "OU(CDWRA)1" Site (l/s) (Including swimming pool backwash)	369.88 l/s

Note and Assumption:

- Number of employees estimated based on 100m² area, which suggests each employee looks after 100 square meters of area within the clubhouse. Referenced form Commercial and Industrial Floor Space Utilization Survey (CIFSUS) conducted by Planning Department.
- Unit flow factors are referenced from EPD guideline – Guidelines for Estimating Sewage Flows for Sewage Infrastructure Planning Version 1.0 (GESF), Food and Beverage (F&B) type commercial activities is equivalent to "J10" Restaurant & Hotel category and Non Food and Beverage (Non F&B) type commercial activities is equivalent to "J4" Wholesale & Retail category under GESF Table T-2.
- Catchment Inflow Factors (PCIF): Yuen Long = 1.00 is adopted.
- Worst case scenario has been considered. It is assumed that the sewage from swimming pools will be discharged together during the peak hour.
- Backwash flow of swimming pool will enter a buffer tank designed to contain a full day backwash volume, with controlled flowrate from the buffer tank, no instantaneous spike of flow will occur during backwash, off-peak discharge to public sewer will be controlled and discharge from buffer tank will last for 12 hours.
- Hydraulic calculation refers to **Appendix 2** and **Appendix 3.**
- Total daily discharge from "R(E)" Residential Site, "R(E)" Primary School Site, "R(E)" Relocated Soy Sauce Factory Site and "OU(CDWRA)1" Site is 7,989.40 m^3/d.
  (i.e. 2,539.77 + 46.24 + 118 + 5,285.39 = 7,989.40 m^3/d)

5.2.5 In comparison with 2016 Scheme, the current proposed development has a larger site area with the inclusion of primary school site and relocated soy sauce factory site. However, the increase in estimated sewage flow from the proposed development (2,704.01m^3/day) and the 2016 Scheme (2,185.6m^3/day) is around 518m^3/day which is insubstantial. The breakdown of sewage flow from the proposed development and previous submission is shown in **Table 10**.

Table 10 Sewage Flow Comparison between 2016 Scheme and Current proposal

Description	2016 Scheme Average Dry Weather Flow (m^3/day)	Current Proposal Average Dry Weather Flow (m^3/day)
Residential	-	2,186.73
Commercial	157.9	14.56
F&B	925.9	319.16
Primary School	-	46.24
Kindergarten	-	12.00
Hotel	927.5	-
Swimming Pool	168.4	7.32
Back of House Facilities	5.9	-
Soy Sauce Factory	-	118
Total flow	2,185.6	2,704.01 (518m^3/day increase)

6. PROPOSED SEWERAGE SYSTEM

6.1.1 As the "OU(CDWRA)1" and "R(E)" sites are located immediately adjacent to each other, the combined impact of both sites are evaluated under this assessment to present the holistic picture. New sewerage terminal manholes will be constructed to serve "R(E)" Site and "OU(CDWRA)1" Site, with downstream sewers needed to be constructed in order to reach the closest public sewerage manhole. The proposed sewerage arrangements refer to **Figure 3**. The new sewerage system will be proposed to connect with the existing public manhole FSH1001880. The new sewerage system will be constructed by the Development and handed over to DSD for future maintenance upon completion.

6.1.2 The treated effluent from the relocated soy sauce factory would be conveyed to the proposed Conversion Chamber 2 by pump and associated rising mains. Similarly, the sewage from the proposed primary school would be conveyed to the proposed Conversion Chamber 1 by pump and associated rising mains. The conversion chambers depressurized the sewage collected upstream and release to manhole (MH01) by gravity sewer. The sewage is then conveyed to proposed sewer manhole (MH04) via a series of 225mm dia. gravity sewer before combining with sewage from "OU(CDWRA)1" and "R(E)" sites. The estimated sewage flow from proposed primary school refers to **Appendix 2** while the hydraulic calculations of proposed sewers refer to **Appendix 4**.

6.1.3 The sewage generated from the proposed "R(E)" Site Residential Development will be discharged via proposed terminal manhole (FTMH2) located at the western boundary of the site. It is proposed that a 450mm dia. gravity sewer will connect to the proposed sewer manhole (MH04) and connected to downstream gravity sewer as shown in **Figure 4**. The estimated sewage flow from proposed "R(E)" Site Residential Development may refer to **Appendix 3** while the hydraulic calculations of proposed sewer may refer to **Appendix 4**.

6.1.4 A series of 450mm dia. to 600mm dia. gravity sewer (i.e. MH04 to FSH1001880) will be proposed to convey the sewage upstream from "OU(CDWRA)1" and "R(E)" sites, relocated soy sauce factory and proposed primary school to existing manhole FSH1001880 at Pok Wai South Road to NSWSPS and ultimately discharge to YLSTW as shown in **Figure 3** and **Figure 4**. The detailed calculations refer to **Appendix 4**.

6.1.5 The gravity sewer would be designed with minimum velocity to achieve self-cleansing according to DSD sewerage manual. Where necessary, trenchless option may be considered to minimise impacts to existing carriageways and pumping station, design will be further reviewed in detailed design stage.

7. SEWERAGE IMPACT DUE TO SHA PO PUBLIC HOUSING DEVELOPMENT

7.1 Impact to the Existing Sewerage System

7.1.1 According to the Feasibility Study Report ("FS Report") for Sha Po Public Housing Development (SPPHD) as contained in the RNTPC Paper No. 9/22 for the proposed amendments to the approved Kam Tin North Outline Zoning Plan No. S/YL-KTN/9, SPPHD proposed to discharge sewage towards SPSPS at rate of 0.153m^3/s with 10% contingency (Approximately 13,219m^3/day in ADWF).

7.1.2 According to Table 8.3 of the FS Report for SPPHD, the design capacity of existing SPSPS is 8,795m^3/day, which is less than the future total average daily flow to SPSPS of 16,727m^3/day. According to Section 8.4.4 of the FS Report for SPPHD, the existing SPSPS is proposed to be upgraded to a design capacity of 16,750m^3/day.

7.1.3 According to Feasibility Study Report for Sha Po Public Housing Site, CEDD is responsible for the construction to upgrade SPSPS, while DSD is responsible for the future maintenance (FS Report section 8.6.1).

7.1.4 The sewage from KTSPS, Proposed Development ("R(E)" Site including "R(E)" Site Residential Development, Primary School Site and Relocated Soy Sauce Factory Site), "OU(CDWRA)1" Site Residential Development, GIC facilities (under separate submission) and SPSPS converge at manhole FSH1001880, followed by the existing DN1200 downstream gravity sewer connecting FSH1001880 and NSWSPS.

7.1.5 According to DSD's information provided, the design capacity of KTSPS is 17,133m^3/day and the current average daily flow of KTSPS is 2,478m^3/day with a pump rate of 377 l/s. The current average daily flow of SPSPS is 1,371m^3/day with a pump rate of 201 l/s. The combined peak discharge is shown in **Table 11**.

Table 11 Peak Sewage Discharge via DN1200 sewer to NSWSPS

Places Sewage Flow From	Type	Value
Proposed "OU(CDWRA)1" Site Residential Development, GIC facilities **(under separate submission)**	ADWF	5,285.39m^3/d
Proposed Development ("R(E)" Site Residential Development, Primary School Site and Relocated Soy Sauce Factory Site)		2,704.01m^3/d
Sub-total		7,989.40m^3/d
	Peaking Factor	4
	Peak Discharge	0.370m^3/s
SPSPS	Pump Rate in m^3/s	0.201m^3/s
KTSPS		0.377m^3/s
Total Peak Sewage Discharge via DN1200 sewer =		**0.948m^3/s**

7.1.6 The existing downstream DN1200 sewer would have adequate capacity to cater for the peak discharge such that no adverse sewerage impact is envisaged. Hydraulic calculations have been included under **Appendix 4**.

7.1.7 The sewage from Proposed Development ("R(E)" Site) (i.e. 2,704.01m^3/d) occupies 6% of the design capacity of existing NSWSPS, 3% of the design capacity of existing YLSTW and 3% of the treated capacity of planned Yuen Long Effluent Polishing Plant (YLEPP) in 2031. The detailed calculations refer to **Appendix 3**.

7.1.8 In addition, a light public housing at Yau Pok Road, Yuen Long by Architectural Services Department (ASD) which also utilize the sewage capacity of NSWSPS. According to **Appendix 5,** the sewage flow estimation from the light public housing is about 1,061m^3/day. Detailed calculation refers to **Appendix 5**.

7.1.9 According to DSD's information provided, the current average daily flow of existing SPSPS and KTSPS is 1,371m^3/day and 2,478m^3/day respectively. With the additional sewage generated from the "OU(CDWRA)1" and "R(E)" sites, the remaining capacity of downstream NSW SPS and planned YLEPP is about 30,021m^3/day and 87,100m^3/day respectively. The result shows that NSWSPS has sufficient capacity to cater for the sewage flow at current levels. No adverse sewage impact is anticipated. The calculation is presented in **Table 12.**

Table 12 NSW SPS and Planned YLEPP Capacity Checking (existing case)

Catchment	Average Daily Flow (m^3/day)	Design Capacity (m^3/day)	Remaining Capacity (m^3/day)
Proposed Development ("R(E)" Site Residential Development, Primary School Site and Relocated Soy Sauce Factory Site)	2,704.01	/	/
Proposed "OU(CDWRA)1" Site Residential Development, GIC facilities **(under separate submission)**	5,285.39	/	/
SPSPS	1,371.00	/	/
KTSPS	2,478.00	/	/
Light Public Housing	1,061.28	/	/
Total	**12,899.68 m^3/day**		
NSW SPS		**42,921.00**	**30,021.32**
Planned YLEPP		**100,000.00**	**87,100.32**

7.1.10 To consider the cumulative sewerage impact with other planned developments utilizing SPSPS, KTSPS, NSWSPS and YLEPP, an assessment has been conducted. Due to limited information available for planned developments, a conservative approach with future average daily flow of upgraded SPSPS and design capacity of KTSPS are adopted for NSWSPS and YLEPP capacity checking. The result shows that remaining capacity is reserved under extreme case. Therefore, no adverse is anticipated. Detailed calculation refers to **Appendix 8**.

8. MAINTENANCE RESPONSIBILITY

8.1.1 The terminal manhole (i.e. FTMH2) and the upstream sewer for R(E) private residential development will be constructed and maintained by the residential development.

8.1.2 The terminal manhole (i.e. FTMH3) and the upstream sewer for primary school will be maintained by operating school, which include the proposed sewage pump house, associated rising mains and conversion chamber (i.e. Conversion Chamber 1).

8.1.3 The terminal manhole (i.e. FTMH4) and the upstream sewer for the relocated soy sauce factory will be maintained by the soy sauce factory, which include the proposed sewage pump house, associated rising mains and conversion chamber (i.e. Conversion Chamber 2).

8.1.4 The associated communal sewers downstream of the conversion chambers (i.e. Conversion Chamber 1 to MH01, Conversion Chamber 2 to MH01 and MH01 to MH05), FTMH2 (i.e. FTMH2 to MH04) will be constructed by "R(E)" private residential development. Upon completion of the proposed sewerage works, the proposed public access will be surrendered to government authority as maintenance access. The public access is proposed to hand over to TD and HyD for maintenance, whereas the communal sewer running underneath the public access will be handed over to DSD for maintenance. The maintenance matrix of the proposed communal sewers and the associated public access could be determined at later land exchange stage following the acceptance of this S.12A rezoning application.

8.1.5 In case the surrendered land become unallocated government land with the maintenance responsibility yet to be assigned to any government department, the proposed "R(E)" private residential development may temporarily take up the maintenance responsibility.

8.1.6 Further to Section 3.1.5, the Development is responsible for the diversion of the existing twin rising mains to Government Land upon the Application Site is proceeded to be developed and handed over to DSD for future maintenance.

8.1.7 The maintenance responsibility for "OU(CDWRA)1" Site refers to SIA report under separate submission (Application No. Y/YL-NSW/8).

9. CONCLUSION

9.1.1 This report aims to assess the sewerage impact arising from the proposed residential development against the existing and planned public sewerage network.

9.1.2 The total increase in sewage discharge is around 518m^3/day compared to 2016 Scheme despite the incorporation of the primary school and relocated soy sauce factory.

9.1.3 The sewage generated from the proposed residential development will be conveyed to the proposed terminal manhole (located at the western edge of the site. It will further drain to the existing gravity sewers along Pok Wai South Road, discharging to existing NSWSPS and ultimately to YLSTW.

9.1.4 The sewage generated from the proposed primary school and relocated soy sauce factory will be discharged to proposed sewer manhole (MH01) via rising main, conversion chambers and a series of 225mm dia. gravity sewer.

9.1.5 The sewage generated from the proposed "R(E)" Site Residential Development will be discharged proposed sewer manhole (MH04) via a 450mm dia. gravity sewer.

9.1.6 A series of 450mm dia. to 600mm dia. gravity sewer will be proposed to convey the sewage upstream from "OU(CDWRA)1" and "R(E)" sites, relocated soy sauce factory and proposed primary school to existing manhole FSH1001880 at Pok Wai South Road to NSWSPS and ultimately discharge to YLSTW.

9.1.7 The existing DN1200 downstream gravity sewer connecting existing public manhole FSH1001880 and NSWSPS is considered adequate as there is no significant sewerage impact due to sewage discharge from SPSPS, KTSPS and Proposed Development including "OU(CDWRA)1" Site Residential Development, GIC facilities and the "R(E)" Site.

9.1.8 The NSWSPS has adequate capacity to cater for the design sewage flow.

9.1.9 The YLSTW and planned YLEPP at 2031 have adequate capacity to cater for the design sewage flow.

1 INTRODUCTION

1.1 Black & Veatch Hong Kong Limited (B&V) have been commissioned to carry out engineering studies to support a Section 12A application for proposed amendments to the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8 in support of a shopping mall cum hotel development at lot 1743 CRP (Part) in DD 107, to the south of Wing Kei Tsuen, Yuen Long (the Application Site).

1.2 The Application Site is located to the south of Wing Kei Tsuen, bounded by Pok Wai South Road and Kam Tin River to the west, Castle Peak Road – Tam Mi Section to the east and Kam Tin River to the south. The Application Site occupies an area of approximately 38,593 m^2 (3.9 hectares). The Application Site is currently zoned as "Open Storage" ("OS"). Please refer to ***Figure H1*** for the location of the Application Site.

1.3 This planning application is proposed to rezone "OS" zone to "Commercial (1)" ("C(1)") zone for the development of shopping mall cum hotel (proposed development).

1.4 The summary of the key information for the proposed development is shown in ***Table H1***.

Table H1 --- Key Information of the Application Site

	Proposed Development
Site Area (m^2)	about 38,593 m^2
Plot Ratio	Not more than 1.5
Total Non-Domestic GFA (m^2)[1] - Commercial Development [2] - Hotel[3]	Not more than 57,890 m^2 Not more than 38,300 m^2 Not more than 19,590 m^2
No. of Hotel Rooms	700

1.5 This report presents the findings of studies on the following assessments to support the Planning Application:

- Examine the existing sewerage facilities in the region;
- estimate the sewage flows generated from the proposed shopping mall cum hotel development; and
- formulate and evaluate sewage disposal scheme.

[1] Excludes back of House facilities of not more than 979.5m^2 (i.e. not more than 5% of the hotel GFA) which is exempted from plot ratio calculation under Building (Planning) Regulation 23A and PNAP 111 (APP-40).
[2] Including shop and services, eating place and place of entertainment.
[3] Including dining facilities, entertainment facilities, business centre, leisure and recreational facilities, function rooms, exhibition and conference facilities.

Previous approved SIA under S12A application - Reference Only

2 EXISTING SEWERGAE FACILITIES IN THE AREA

2.1 The Application Site is presently unsewered. In 2010, three nos. of sewage pumping station, namely Sha Po Sewage Pumping Station (SPSPS), Nam Sang Wai Sewage Pumping Station (NSWSPS) and Kam Tin Sewage Pumping Station, including the associated gravity sewers / rising mains were completed and in operation in Au Tau, Pat Heung, Sha Po and Nam Sang Wai areas respectively.

2.2 The SPSPS is located at San Tam Road, to the east of the proposed development. The SPSPS has a design capacity of approximately 8,795m^3/day. Sewage collected by the SPSPS will be conveyed to NSWSPS and ultimately discharged to the Yuen Long Sewage Treatment Works (YLSTW) for treatment and disposal. The design capacity of NSWSPS is about 35,000 m^3/day.

3 ESITMATED QUANTITY OF SEWAGE TO BE GENERATED

3.1 The estimated sewage to be generated from the proposed development is presented in ***Tables H2:***

Previous approved SIA under S12A application - Reference Only

Table H2 --- Estimated Sewage Flow from the Proposed Shopping Mall cum Hotel Development

- Commercial Development GFA - Hotel GFA - Area for back of house facilities - Swimming pool	38,300 m^2 19,590 m^2 979.5 m^2
By conservative approach for estimating sewage flow, 30% of the commercial development GFA is assumed to be eating place: - Commercial Development (eating place) GFA - Commercial Development (others) GFA The area of potential swimming pool is conservatively assumed to be 1,250m^2: - Hotel GFA - Hotel (swimming pool) GFA	 11,490 m^2 26,810 m^2 18,340 m^2 1,250 m^2
Design Population - Commercial Development (eating place)[4] - Commercial Development (others)[5] - Hotel[6] - Back of house facilities[5]	 586 564 587 21
Global unit flow factor[7] - Commercial Development (eating place) - Commercial Development (others) - Hotel - Back of house facilities	 1.58 m^3/d 0.28 m^3/d 1.58 m^3/d 0.28 m^3/d
Predicted ADWF - Commercial Development (eating place) - Commercial Development (others) - Hotel - Hotel (swimming pool) - Back of house facilities	 925.9 m^3/d 157.9 m^3/d 927.5 m^3/d 168.4 m^3/d[8] 5.9 m^3/d
Total Predicted ADWF	2,185.6 m^3/d
Contributing Population = Total ADWF / 0.27	8,095 persons

[4] A density of 5.1 employees per 100 m^2 GFA (restaurant in Private Commercials) is adopted in accordance with the results of the "Commercial and Industrial Floor Space Utilization Survey" conducted by the Planning Departing in 2004/2005.

[5] A density of 2.1 employees per 100 m^2 GFA (retail trade in Private Commercials) is adopted in accordance with the results of the "Commercial and Industrial Floor Space Utilization Survey" conducted by the Planning Departing in 2004/2005

[6] A density of 3.2 employees per 100 m^2 GFA (hotels) is adopted in accordance with the results of the "Commercial and Industrial Floor Space Utilization Survey" conducted by the Planning Departing in 2004/2005

[7] Refer to Guidelines for Estimating Sewage Flows published by Environmental Protection Department in March 2005.

[8] Average discharge rate for government swimming pool, Annex 1 of Appendix V, Guidelines for Estimating Sewage

Previous approved SIA under S12A application - Reference Only

4 PROPOSED SEWAGE DISPOSAL SCHEME

4.1 Local sewage treatment facilities will be adopted, as an interim measure, for treatment and disposal of the sewage generated from the proposed development. The treated sewage will be discharged to Kam Tin River through the proposed twin 900mm diameter drains as shown in ***Figure G5*** in the ***Drainage Impact Assessment***.

4.2 The local sewage treatment facilities will be constructed and maintained by the owner at his own cost. To achieve the "no net increase in pollution loads to Deep Bay" principle, water in existing 5.3x3.8m twin cells box culvert will be intercepted for treatment by the interim local sewage treatment facilities, so as to compensate the increased pollution loads due to the proposed development. Tertiary level sewage treatment with Membrane Bioreactor (MBR) technology (or other technical feasible technology) will be employed for sewage treatment. Since water sampling results, flow measurement results and detailed site measurement are not available at this planning stage, the Applicant will carry out detailed site survey and water samplings at the existing box culvert at the detailed design stage. Detailed design of the local sewage treatment facilities including the proposed stream water interception of the existing box culvert will be submitted to relevant Authorities for agreement in the detailed design stage. If it is found that the proposed tertiary level sewage treatment is not sufficient to meet the "no net increase in pollution loads to Deep Bay" principle in the detailed design stage, further water purification / disinfection technology such as **Reverse Osmosis** (i.e. equal to no additional pollution load to Kam Tin River) will be adopted for treatment of sewage to meet "no net increase in pollution loads to Deep Bay" principle.

4.3 For ultimate sewage disposal scheme, sewage generated from the proposed development will be discharged to the SPSPS. An approximately 100 m long gravity sewer is proposed to be laid to convey sewage from the proposed development to the SPSPS. The sewer will be laid across Castle Peak Road – Tam Mi and San Tin Highway and then connected to the inlet manhole outside the SPSPS. Sewage at SPSPS will then be conveyed to NSWSPS through existing rising mains and trunk sewer.

4.4 Preliminary alignment of the proposed sewer and the proposed connection for ultimate sewage disposal scheme are shown on ***Figures H2 and H3*** respectively.

Capacity of Existing Sewerage System

4.5 The total estimated sewage generated from the proposed development is 2,185.6 Flows published by Environmental Protection Department in March 2005.m^3/day (ADWF) with a peaking factor of 5 (for sewer design with contributing population range of 5,000~10,000). The design capacity of SPSPS is 8,795 m^3/day, for which is much larger than the sewage generated from the proposed development. At the ultimate sewage discharge stage, subjected to approval of relevant Authorities, sewage from the proposed development will be discharged to SPSPS. The design checking of the proposed sewer at ultimate stage is shown in ***Annex H1***.

Previous approved SIA under S12A application - Reference Only

4.6 The current design capacity of NSWSPS is 35,000 m^3/day. Sewage from the proposed development will be discharged to NSWSPS via SPSPS at the ultimate sewage discharge stage. The time of implementation of the ultimate sewage discharge stage shall be subjected to approval of relevant Authorities.

5 EVALUATION OF THE SEWAGE DISPOSAL SCHEME AND RECOMMENDATIONS

Regional sewerage strategy

5.1 Interim local sewage treatment for sewage and existing stream water interception to achieve "no net increase in pollution loads to Deep Bay" principle is a feasible scheme. Discharge of sewage to public sewerage system at the ultimate sewage disposal scheme is also a feasible option and is in line with Government's sewage treatment and disposal strategies.

Land matters

5.2 The full section of the connection sewer at ultimate stage will run along government land. It is not envisaged that requisition of private lot would be required for construction nor future operation.

Environmental impact

5.3 The proposed interim local sewage treatment facilities and stream water interception will be designed to meet the "no net increase in pollution loads to Deep Bay" principle. The proposed ultimate sewage disposal stage involves discharge to public sewerage system via a new gravity sewer constructed by the developer. Both stages will have insignificant environmental impact.

Construction

5.4 Construction of gravity sewer from the Application Site to the SPSPS at the ultimate stage would mainly involve conventional technology such as cut and cover excavation techniques. However, to minimize disruption to the pedestrian and vehicular traffic, adoption of trenchless construction method will be explored for the portions of sewer crossing San Tin Highway and at other location as appropriate. There is no significant constraint in terms of complexity by a general civil works contractor. Details of the proposed sewer will be submitted to relevant departments for agreement at detailed design stage.

Previous approved SIA under S12A application - Reference Only

6 CONCLUSION

6.1 The estimated sewage generated from the proposed development is 2,185.6 m^3/d. Local sewage treatment facilities will be adopted, as an interim measure, for treatment and disposal of the sewage generated. At the ultimate sewage discharge stage, sewage generated from the proposed development will be discharged to public sewerage system. Time of implementation of ultimate sewage discharge stage shall be subjected to the approval of relevant Authorities.

6.2 The proposed sewage disposal scheme is considered feasible in terms of regional sewerage strategy, land, and environmental impact and construction considerations. The proposed development is considered sustainable in terms of sewerage.

Total Peak Flow from the Proposed Development (l/s)	=	**369.88**	

	Design Capacity	Flow from "R(E)" Site Only (ADWF)	Capacity Check
	(m^3/day)	(m^3/day)	%
NSW SPS	42,921	2,704	6
YLSTW (Existing)	100,000	2,704	3
YLEPP (at 2031)	100,000	2,704	3

Notes:

1. Person-Per-Flat ratio (PPoF) of 2.6 with reference to the recommendation under HK2030+ (Oct 2021).
2. Contributing population = Projected Flow (ADWF in m^3/day) / 0.27 (m^3/person/day)
3. Nam Sang Wai Sewerage Pumping Station (NSWSPS), Yuen Long Sewage Treatment Works (YLSTW) and Upgrade the Yuen Long Sewage Treatment Works (YLSTW) to the Yuen Long Effluent Polishing Plant (YLEPP)
4. Adopt Non-F&B = 70% of Clubhouse Area and F&B = 30% of Clubhouse Area, while for Retail Area F&B=100% for assessment purposes only.
5. Worst case scenario (all swimming pools will undergo backwash at the same time) is assumed.
6. Catchment Inflow Factors (PCIF): Yuen Long = 1.00 is adopted.
7. According to Education Bureau Key Statistics on kindergarten Pupil-Teacher Ratio of 8.1:1. The proposed kindergarten has 8 classrooms with an average class size of 20. (One kindergarten with 1000m^2 is proposed for the Development)
8. According to CIFSUS, the worker density for private commericals' Retail Trade is assumed as 2.1 workers per GFA (in 100 m^2)
9. According to CIFSUS, the worker density for private commericals' Restaurants is assumed as 5.1 workers per GFA (in 100 m^2)
10. According to Education Bureau Key Statistics on Primary School Pupil-Teacher Ratio of 13.0:1. The proposed primary school has 30 classrooms in total with an average class size of 25.

Notes:
(1) Assume the pipe flows under full-bore capacity.
(2) Adopt Non-F&B = 70% of Clubhouse Area and F&B = 30% of Clubhouse Area, while for Retail Area F&B=100% for assessment purposes only.
(3) Assume the proposed sewerage pipes from Conversion Chamber to MH04, and FTMH2 to MH04 to be slimed concrete sewers to about half depth; velocity, when flowing half full, approximately 1.2 m/s under normal condition.
(4) Assume the proposed sewerage pipes from MH04 to FSH1001880 to be slimed concrete sewers to about half depth; velocity, when flowing half full, approximately 1.2 m/s under normal condition.
(5) Assume the existing sewerage pipes are slimed concrete sewers to about half depth; velocity, when flowing half full, approximately 1.2 m/s under poor condition.
(6) Peaking factor excluding stormwater allowance is adopted for proposed sewer hydraulic checking between proposed sewer manhole MH01 and FSH1001880, FTMH2 and MH04, Conversion Chamber to MH01.
(7) Peaking factor including stormwater allowance is adopted for existing sewer hydraulic checking between existing sewer manhole FSH1001880 to FSH1001886.
(8) According to DSD information provided, the pump rate of Sha Po SPS is 201 l/s = 0.201 m^3/s
(9) According to DSD information provided, the pump rate of Kam Tin SPS is 377 l/s = 0.377 m^3/s

Appendix 5

Estimated Sewage Flow from Light Public Housing

Sewage Flow Estimation of Light Public Housing

Estimated Sewage Flow from Light Public Housing		
Residential Population (person)	=	5,500 (1), (2)
Unit Flow Factor (m^3/d/head)	=	0.19
DWF (m^3/day)	=	1,045.00
DWF (l/s)	=	12.095
Non-domestic GFA (m^2)	=	1,075.00 (1)
Community Facilities GFA (m^2)	=	537.50 (3)
Retail GFA (m^2)	=	537.50 (3)
Community Facilities GFA (m^2)	=	537.50
Assumed Worker Density (workers per GFA (in 100 m^2))	=	3.30 (5)
Staff (no.)	=	18
Unit Flow Factor (m^3/d/head)	=	0.28
DWF (m^3/day)	=	5.04
DWF (l/s)	=	0.058
Retail F&B GFA (m^2)	=	161.25 (4)
Assumed Worker Density (workers per GFA (in 100 m^2))	=	5.10 (6)
Restaurant staff (no.)	=	8
Unit Flow Factor (m^3/d/head)	=	1.58
DWF (m^3/day)	=	12.64
DWF (l/s)	=	0.146
Retail non-F&B GFA (m^2)	=	376.25 (4)
Assumed Worker Density (workers per GFA (in 100 m^2))	=	3.50 (7)
Non-restaurant staff (no.)	=	13
Unit Flow Factor (m^3/d/head)	=	0.28
DWF (m^3/day)	=	3.64
DWF (l/s)	=	0.042
Total DWF (m^3/day)	=	**1,061.28**
Total DWF (l/s)	=	**12.28**

1. Information extracted from "Light Public Housing at Yau Pok Road, Yuen Long - Project Profile".
2. For conservative purpose, maximum 5,500 design population is adopted.
3. The non-domestic GFA is assumed 50% Retail and 50% Community Facilities.
4. The retail GFA is assumed 30% F&B and 70% non-F&B.
5. Worker density refers to Table 8 of Commercial and Industrial Floor Space Utilisation Survey (CIFSUS) for "Community, Social & Personal Services" - All types
6. Worker density refers to Table 8 of Commercial and Industrial Floor Space Utilisation Survey (CIFSUS) for "Restaurants" - All types.
7. Worker density refers to Table 8 of Commercial and Industrial Floor Space Utilisation Survey (CIFSUS) for "Retail Trade" - All types.

Appendix 6

Existing Soy Sauce Factory Discharge License

Licence No.: 牌照編號 :	WT00042212-2022
This Licence is Valid to : 本牌照有效期至 :	30/06/2027

ENVIRONMENTAL PROTECTION DEPARTMENT
環境保護署

WATER POLLUTION CONTROL ORDINANCE (CAP. 358)
水污染管制條例（第358章）

LICENCE PURSUANT TO SECTION 20
按第20條簽發的牌照

The Director of Environmental Protection ("the Authority") grants this licence under the Water Pollution Control Ordinance ("the Ordinance") on the terms and conditions stated below.

環境保護署署長（「監督」）按下列的條款及條件，根據水污染管制條例（「本條例」）批給此牌照。

18 Oct 2022
Date
日期

(LEUNG Man-lung)
For *the Authority*
監督 (梁文龍 代行)

PART A 甲部 : GENERAL TERMS 一般條款

Name of Licensee ("the Licensee") 持牌人名稱（「持牌人」）	Koon Chun Hing Kee Soy & Sauce Factory Limited 冠珍興記醬園有限公司
Discharge Premises ("the premises") 排放處所（「處所」）	DD 107, Lot 1910, Au Tau, Yuen Long, N.T. 新界元朗凹頭第107約第1910號地段
Water Control Zone 水質管制區	Deep Bay Water Control Zone 后海灣水質管制區
Discharge Category 排放種類	Discharge of industrial trade effluent 工業污水排放
Nature of Discharge 排放性質	Trade effluent arising from the premises 源自上址的行業污水
Wastewater Treatment Facilities 廢水處理設施	Screen, Grease trap, Chemical precipitation tank, Equalization tank, Sequencing batch reactor system, Activated carbon filter, pH adjustment, Sludge conditioning tank, Filter press and Sludge holding tank 隔篩、隔油池、化學沉澱池、均衡池、順序分批式反應器系統、活性碳過濾器、酸鹼值調節、淤泥調節缸、壓濾機及淤泥儲存缸
Discharge Point(s) 排放點	Discharge into communal drain (Marked as D.P. in Annex I) 排放入公用雨水渠 (如附件I中D.P. 位所示)
Sampling Point(s) 抽樣點	Sampling point(s) at discharge outlet(s) of the Wastewater Treatment Facilities (Marked as S.P. in Annex II) 抽樣點於廢水處理設施的排水口 (如附件II中S.P. 位所示)

PART B 乙部 : SPECIFIC CONDITIONS 特定條件

B1. Limitations on Discharge 排放限制

The characteristics or constituents of any discharge (including that taken at the Sampling Point(s) specified in Part A of this licence) from the premises shall not exceed the limits stated in the table below[Note (a)]. All figures are upper limits unless otherwise indicated. All units are expressed as concentration in milligramme per litre unless otherwise stated.

任何來自處所的排放（包括在本牌照甲部指明的抽樣點所抽取的排放樣本）的特性或構分不得超過下表所列的限度[附註 (a)]。除另有標示外，所有數字均為上限。除另有註明外，所有單位均以毫克／公升作濃度表示。

Determinand 測量物	Limit 限度
Flow Rate (m^3 / day) 流量（立方米/日）	50
pH (pH units) 酸鹼值 (pH 單位)	6-10
Temperature (°C) 溫度 (攝氏)	30
Colour (Lovibond units)(25mm cell length) 色度(羅維保德色調計)(25 毫米光度管)	1
Suspended Solids 懸浮固體	30
Biochemical Oxygen Demand (5 days, 20 °C) 生化需氧量 (5 天, 20°C)	20
Chemical Oxygen Demand 化學需氧量	80
Oil & Grease 油類及油脂	10
Chloride 氯化物	1000
Surfactants (total) 表面活化劑 (總量)	15
Nitrate + nitrite nitrogen 硝酸鹽+亞硝酸鹽氮	50
E. coli (count/100ml) 大腸桿菌(個／100 毫升)	1000

B2. Self-monitoring and Reporting 自動監察及報告

☐ The Licensee shall perform self-monitoring and make the results of the monitoring available as and when required by the Authority.
持牌人須在監督要求時進行自動監察及呈交監察結果。

☑ The Licensee shall carry out routine self-monitoring and recording of the constituents, by collecting and analyzing sample(s), of the discharge at the Sampling Point(s) at his own expense in accordance with the sampling type and measurement frequency specified for each determinand named below:
持牌人須依照下列每種測量物指定的抽樣類別及頻率，自費收集及分析抽樣點的排放樣本，從而進行例行自動監察及記錄有關構分。

Determinand 測量物	Unit 單位	Sampling Type 抽樣類別	Frequency 頻率
Biochemical Oxygen Demand (5 days, 20 °C) 生化需氧量 (5 天, 20°C)	mg/L 毫克/升	Grab 抓取	Quarterly 每三個月一次
Oil & Grease 油類及油脂	mg/L 毫克/升	Grab 抓取	Quarterly 每三個月一次

Results of these monitoring shall be summarized in a report and shall be made available to the Authority by submitting the report to the Authority on a quarterly basis.
所有監測結果須以摘要形式，每三個月作出報告，並須呈交監督審閱。

PART C 丙部 : STANDARD CONDITIONS 標準條件

C1. The Discharge 排放

The discharge or deposit shall not contain prohibited substances including polychlorinated biphenyls (PCB), polyaromatic hydrocarbon (PAH), fumigant, pesticide, toxicant, radioactive substances, chlorinated hydrocarbons, flammable or toxic solvents, petroleum oil or tar, calcium carbide; any substance likely to damage the sewer or to interfere with any of the treatment processes, or to be harmful to the health and safety of any personnel engaged in the operation or maintenance of a sewerage system; waste liable to form scum or deposits in any part of the drainage or sewerage system, or the waters of Hong Kong; waste liable to form discolouration in any parts of the waters of Hong Kong; sludge, floatable substances or solids larger than 10 mm; and sludge or solid refuse of any kind.

排放或沉積不得含有受禁止物質，包括多氯聯苯、聚芳烴、薰蒸劑、除害劑、毒劑、放射性物質、氯化烴、可燃或有毒溶劑、石油或焦油、碳化鈣；任何可能會損害污水渠或干擾任何處理程序的物質，或有損操作或保養排污系統人員健康及安全的物質；可能在排水或排污系統任何部分或香港水域任何範圍內形成浮渣或沉積的廢物；可能在香港水域任何範圍內形成變色的廢物；污泥、漂浮物質或大於 10 毫米的固體；以及任何種類的污泥或固體垃圾。

C2. Flow Measurement 量度流量

The Licensee shall determine the flow rate of the discharge by providing, operating and maintaining a continuous flow measuring device with an accuracy certified by its manufacturer to be within plus or minus 3 percent of the actual flow, and shall calibrate the flow measuring device regularly according to manufacturer's recommendations. If no such device is provided, the Licensee shall determine the flow rate through using calculation methods agreed by the Authority, by making reference to the amount of water used in the premises being served by mains supply and other sources, less process consumption and any other losses.

持牌人必須提供、操作及保養一個連續性流量計以測量排放的流量率，其準確程度須經其製造商核證為不超逾或低於實際流量的 3%，並須根據製造商建議的方法，定期校準流量計。如沒有提供該設備，持牌人須使用監督同意的計算方法，根據處所由自來水及其他水源供應的用水量減去工序耗水量及任何其他耗水量來測定流量率。

C3. Treatment 處理

C3.1 The Licensee shall provide appropriate wastewater treatment facilities, and engage personnel with adequate qualification and experience to properly operate and maintain all wastewater treatment facilities at all times. No discharge shall bypass the respective wastewater treatment facilities, the Sampling Point(s), or the Discharge Point(s) as stipulated in Part A of this licence unless it is unavoidable to prevent loss of life, personal injury or severe property damage and no feasible alternative exists. Dilution of the discharge to achieve compliance with the limits contained in this licence is prohibited.

持牌人須提供適當的廢水處理設施，並須僱用具備足夠資格及經驗的人士時刻適當操作及保養所有廢水處理設施。除非為避免引致人命傷亡或嚴重財物損失，及無其他可行代替辦法，否則排放不得繞過本牌照甲部訂明的各個廢水處理設施、抽樣點或排放點。不得將排放稀釋，以求符合本牌照內所訂的限度。

C3.2 The Licensee shall provide standby equipment to guard against failure of major treatment equipment. In the event of loss of efficiency of operation, or failure of all or part of the wastewater treatment facilities, the Licensee shall take all reasonable steps, including the use of standby wastewater treatment equipment, to the extent necessary to maintain compliance with this licence. Such steps shall remain until operation of the wastewater treatment facilities is restored or an alternative method of treatment is provided.

持牌人須提供備用設備，以供在主要處理設備發生故障時使用。倘若所有或部分廢水處理設施操作失靈或發生故障，持牌人須採取一切必需的合理措施，包括使用備用廢水處理設備，以求符合本牌照的規定。此等措施須維持至廢水處理設施恢復正常運作或有其他代替的處理方法為止。

C3.3 If appropriate wastewater treatment facilities are not provided, or the wastewater treatment facilities are not properly operated, nor maintained to the satisfaction of the Authority, the Licensee shall take immediate and effective remedial actions as required by the Authority.

倘若沒有提供適當的廢水處理設施，或沒有適當地操作或保養廢水處理設施以令監督滿意，持牌人須按監督要求採取即時及有效的補救行動。

C4. Disposal 處置

Sludge, screenings including solids, oil and grease, screenings generated by filter backwash, or other pollutants removed in the course of treatment shall be disposed of in a proper manner[Notes (b) & (c)].

污泥、隔濾物（包括固體、油類及油脂、過濾器回洗所產生的隔濾物，或處理過程中所移走的其他污染物）均

須以適當方式處置[附註(b)及(c)]。

C5. Monitoring 監察

C5.1 The Licensee shall provide suitable and accessible facilities at each Sampling Point, such as inspection chamber(s), manhole(s) or sampling valve(s), and properly operate and maintain these facilities to enable duly authorized officer(s) of the Authority to take samples of the discharge from the premises at any time.

持牌人須在每個抽樣點提供適當和可取用的設施，例如檢查室、沙井或抽樣閥，並適當地操作和保養這些設施，以便獲監督正式授權的人員可隨時在處所內抽取排放樣本。

C5.2 For self-monitoring, "grab samples" shall be taken during the period when the determinand to be analyzed for is likely to be present in its maximum concentration. "Composite samples" shall include samples taken over daily duration of the discharge.

在自動監察中，「抓取樣本」須在擬分析的測量物可能處於最高濃度的時段內抽取。「綜合樣本」須包含在每日排放期間不同時候所抽取的樣本。

C5.3 For self-monitoring, all samples shall be analyzed in accordance with the most updated analytical methods used by the Government Chemist[Note (d)].

在自動監察中，所有樣本須按照政府化驗師所採用的最新分析方法予以分析[附註(d)]。

C6. Keeping Records and Reporting Incident to Authority 保存紀錄及向監督報告事故

C6.1 The Licensee shall keep the following records in the premises and shall make them available for inspection by duly authorized officer(s) of the Authority:

持牌人須在處所內保存下列紀錄，以備獲監督正式授權的人員查閱：

(i) records of flow rate, characteristics and constituents of the discharge;
排放流量率、特性及構分的紀錄；

(ii) updated records of all monitoring information, including all laboratory analytical results relating to samples taken, all original chart recordings for continuous flow and pH monitoring; and
所有最新監察資料的紀錄，包括所有關於已抽取樣本的檢驗分析結果、所有連續性流量及酸鹼值監察紀錄圖表的正本；及

(iii) records of all desludging and operations which generate screenings including solids, oil and grease, screenings generated by filter backwash, and records of the corresponding disposal operation.
所有清除污泥工作及產生隔濾物（包括固體、油類及油脂、過濾器回洗所產生的隔濾物）的工序的紀錄，以及其處置工序的紀錄。

The Licensee shall submit copies of all such records to the Authority upon request.
持牌人在監督要求時須向監督呈交所有該等紀錄的副本。

C6.2 The Licensee shall notify and explain to the Authority: Director of Environmental Protection, Regional Office (N), by fax (fax no.: 2685 1155) or electronic mail (email address: hotline_n@epd.gov.hk) within 24 hours upon the occurrence of any emergency such as an accidental discharge, an emergency bypass, an overflow of untreated effluent, or an operation upset which places the discharge in a temporary state of non-compliance with this licence. The Licensee shall within 7 days following the incident, submit to the Authority a detailed report in writing on the cause and duration of the non-compliance and steps taken or to be taken to reduce, eliminate, or prevent recurrence of such non-compliance. Reporting in accordance with this Condition does not relieve the Licensee of any obligations imposed by this licence.

遇到任何緊急事故，例如有未經處理的污水意外排放、緊急繞流或溢滿的事件，引至排放出現短暫不符合本牌照規定的情況，持牌人須在事發後24小時內透過傳真（傳真號碼：2685 1155）或電郵（電郵地址：hotline_n@epd.gov.hk）通知監督（致：環境保護署署長，經：區域辦事處（北）），並予以解釋。持牌人須在事故發生後7天內，向監督提交書面報告，詳述事件的起因、違反牌照條件的持續時間，以及為減少、消除或防止類似事件再次發生所採取或將會採取的措施。然而，按照本條件的規定提交報告並不表示持牌人可獲免除承擔本牌照內所載的任何責任。

C7. Operation Manual 操作手冊

For proper operation and maintenance of the wastewater treatment facilities, the Licensee shall prepare an operation manual, which shall include but not limited to operating procedures, inspection programme and repair and maintenance programme for the wastewater treatment facilities. The operation manual shall be

kept at the wastewater treatment facilities and a copy of the manual shall be submitted to the Authority upon request.

為適當操作及保養廢水處理設施，持牌人須擬備一份操作手冊，內容須包括但不限於廢水處理設施的操作程序、檢查、維修及保養工作計劃表。操作手冊須存放於廢水處理設施，而持牌人須在監督要求時，呈交手冊副本乙份。

C8. Notification of Change 更改通知

The Licensee shall notify the Authority: Director of Environmental Protection, Regional Office (N), by fax (fax no.: 2685 1155) or electronic mail (email address: hotline_n@epd.gov.hk) in writing within 14 days of any changes or proposed changes in the wastewater treatment methods or facilities, the processes of manufacture or the nature of the raw materials used or of any other circumstances which may alter the characteristic or constituent of the discharge or deposit, or may result in the permanent cessation of the discharge.

倘若持牌人更改或擬更改其廢水處理方法或設施、生產程序、或所用原料的性質，或有任何其他可改變排放或沉積的特性或構分或可導致永久終止排放的情況，持牌人必須在有關更改或情況發生後 14 天內透過傳真（傳真號碼：2685 1155）或電郵（電郵地址：hotline_n@epd.gov.hk）以書面方式通知監督（致：環境保護署署長，經：區域辦事處（北））。

Notes 附註

(a) For the purposes of determining compliance with the limits stated in Specific Condition B1, duly authorized officer(s) of the Authority shall take samples at the Sampling Point(s) as stipulated in Part A of this licence or any other points from which the samples so taken are regarded by the duly authorized officer(s) as being representative of the quality of the discharge. When any single sample analyzed for a determinand is proved not complying with corresponding limit set out in the table, the discharge is deemed to have failed to comply with Specific Condition B1.
為確定排放是否符合特定條件 B1 項所列的限度，獲監督正式授權的人員須在本牌照甲部訂明的抽樣點或在有關獲正式授權人員認為可以抽取到在排放的素質方面具代表性的樣本的任何其他地點抽取樣本。只要在任何一個經分析的樣本中，證實任何一種測量物不符合表中所列的相應限度時，排放即被視為不符合特定條件 B1 項。

(b) An example of proper disposal method for sludge is sending dewatered sludge to landfill for disposal.
妥善處置污泥方法的一個例子是將脫水後的污泥運往堆填區處置。

(c) Proper disposal of grease trap waste includes but not limited to employing registered grease trap waste collector(s) to conduct the disposal work. All registered collectors should have a Certificate of Registration issued by the Environmental Protection Department. The most updated list of the registered collectors can be obtained from the Environmental Protection Department.
妥善處置隔油池廢物包括但不限於聘用已登記的隔油池廢物收集商進行有關的處置工作。所有已登記的隔油池廢物收集商，均領有由環境保護署發出的登記證明書。已登記隔油池廢物收集商的最新名單，可向環境保護署索取。

(d) The Licensee may make reference to Annex 1 of the <Technical Memorandum - Standards for Effluents Discharged into Drainage and Sewerage Systems, Inland and Coastal Waters> for analytical methods used by the Government Chemist.
持牌人可參照《技術備忘錄：排放入排水及排污系統、內陸及海岸水域的流出物的標準》附件 1 有關政府化驗師所採用的分析方法。

(e) The Licensee shall keep this licence in the premises and make it available at all times for inspection by duly authorized officer(s) of the Authority.
持牌人須在處所內保存本牌照，以備獲監督正式授權的人員隨時查閱。

(f) (i) The Licensee shall allow duly authorized officer(s) of the Authority to enter the premises for the purposes of inspection, sampling, records examination or any other duties authorized by Section 37 and Section 38 of the Ordinance.
持牌人須准許獲監督正式授權的人員進入處所內進行檢查、抽取樣本、審查紀錄或執行其他根據本條例第 37 及 38 條所授權的職務。

(ii) Where the premises has security measures in force which would require proper identification and clearance before entry, the Licensee shall make necessary arrangements such that upon presentation of evidence of identity and of authorization, duly authorized officer(s) of the Authority will be permitted to enter, without delay, for the purposes of performing duties.
倘若由於處所保安理由而需在進入處所前先行鑑定訪客身份，持牌人必須作出必需的安排，以便獲監督正式授權人員在出示身份證明及授權文件後，即可內進執行其職務而不致受延誤。

(g) For a licence granted under Section 20 of the Ordinance, the Licensee may, not earlier than 4 months and not later than 2 months before the date of expiry of the licence, apply under Section 23 of the Ordinance for renewal of licence. The Authority may renew the licence or otherwise.
對於持有根據本條例第 20 條所批給的牌照，持牌人可於牌照期限屆滿日期前不早於 4 個月以及不遲於 2 個月，根據本條例第 23 條的規定申請牌照續期。監督可將牌照續期或拒絕將牌照續期。

(h) Under Section 24 of the Ordinance, the Authority may by notice in writing, impose new or amended terms and conditions on this licence or cancel this licence. Under Section 25, 26 and 27 of the Ordinance, a Licensee whose licence has been so varied or cancelled may be entitled to compensation.
根據本條例第 24 條的規定，監督可以書面通知，向本牌照施加新訂或經修訂的條款及條件，或取消本牌照。根據本條例第 25、26 及 27 條的規定，被更改或取消牌照的持牌人可能會獲得補償。

(i) Under Section 28 of the Ordinance, the Licensee may apply to the Authority for a variation of this licence.
根據本條例第 28 條的規定，持牌人可向監督申請更改本牌照。

(j) Under Section 49 of the Ordinance, this licence shall not be construed as a dispensation from the requirements of any other Ordinance except where that other Ordinance so provides.
根據本條例第 49 條的規定，本牌照不得解釋為豁免符合任何其他條例的規定，除非該其他條例如此訂定。

1. INTRODUCTION

1.1 Background

1.1.1 AECOM Asia Company Limited (AECOM) have been commissioned to carry out engineering studies to support Section 12A Planning Application for Proposed Amendments to the Nam Sang Wai Outline Zoning Plan from "I(D)" and "OS" Zones to "R(E)" Zone at Lots 1910 RP (Part) and 1743 S.C RP (Part) in D.D.107 and Adjoining Government Land, West of Castle Peak Road - Tam Mi, Yuen Long.

1.1.2 The Application Site occupies an area of approximately 81,550m^2. The Application Site is bounded by Pok Wai South Road and Kam Tin River to the west and Castle Peak Road – Tam Mi Section to the east. The detailed location is shown in **Figure 1**.

1.1.3 The Application Site including area currently zoned as "Industrial (Group D) (I(D))" and part of "open storage (OS)" under the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8, which is proposed to rezone as "Residential (Group E) (R(E))" hereafter "R(E)" Site. The remaining part of "OS" site is proposed to rezone as "R(E)" to use for relocation of soy sauce factory which currently located in "I(D)" hereafter "I(D)" Site.

1.1.4 Another area currently zoned as "Other Specified Uses (Comprehensive Development to include Wetland Restoration Area)" ("OU(CDWRA)") located to the north of the Application Site is proposed to be rezoned into "OU(CDWRA)1" zone for private residential development under separate submission.

1.1.5 In order to assess the combined impact of the "R(E)" and "OU(CDWRA)1" sites, the proposed parameters of both sites are included under this assessment to present the holistic picture.

1.1.6 The WSIA report serves as a supportive document for application under Section 12A of Town Planning Ordinance (Cap 131).

1.2 Previous Approved Water Supply Impact Assessment

1.2.1 A previous Section 12A application was approved in 2016. The application for amendment to the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8 involved rezoning of an "Open Storage"("OS") to "Commercial" ("C").

1.2.2 The Open Storage was entirely within current application with an area of 38,593m^2. According to previous indicative development proposal, the development consisted of commercial elements including shopping mall and 700-room hotel development.

1.2.3 In previous approved WSIA, the fresh and flushing water demands were 1712.3 m^3/day. A new 200mm dia. watermain was proposed to be branched off from existing fresh water main running along Castle Peak Road. As no flush water main was provided in the vicinity, flushing water demanded was met by the same existing 200mm dia. water main. The extract of approved WSIA for previous Section 12A application is attached in **Appendix 1**. This approved scheme (hereafter "2016 Scheme") will be referred for comparison to the current application.

1.3 **Objective of this Submission**

1.3.1 This report outlines the assessment results of the potential water supply impacts generated by the Proposed Development at the Application Site. The main objectives of this assessment include the followings:

(i) Determine the water demand arising from the Proposed Development;

(ii) Assess the impact of the water demand arisen from the Proposed Development to the existing water supply system; and

(iii) Propose any appropriate mitigation measures, if required.

2. DEVELOPMENT PROPOSAL

2.1 The Proposed Development

2.1.1 The "R(E)" Site residential portion has an area of approximately 46,501m^2 with a domestic Gross Floor Area (GFA) at about 115,942m^2.

2.1.2 The Master Layout Plan (MLP) of the Application Site is shown in **Figure 2**. The details of the proposed development schedule are summarized in **Table 1 and 2**. The comparison table of development schedule between 2016 Scheme and proposed scheme is shown in **Table 3** below.

Table 1 Development Schedule for the "R(E)" Site (subject application) (Application No. Y/YL-NSW/9)

"R(E)" Site Area	
"R(E)" Site Area	About 81,550 m^2
Primary School Site Area	About 6,200 m^2
Soy Sauce Factory Site Area (1)	About 27,459 m^2
3rd Parties Lots	About 1,390 m^2
"R(E)" Residential Development Site Area	About 46,501 m^2
"R(E)" Site No. of Residential Units	3,115 units
Person per Flat Ratio (PPoF) (2)	2.6
"R(E)" Site Residential Population	8,099

Notes:

(1) Excluding portion of Government land (3rd parties Lots) currently occupied by some temporary structures at the western portion of the Application Site with an area of about 1,390m^2

(2) Person-Per-Flat ratio (PPoF) of 2.6 with reference to the recommendation under HK2030+ (Oct 2021)

Table 2 Development Schedule for the "OU(CDWRA)1" Site (under separate application) (Application No. Y/YL-NSW/8)

"OU(CDWRA)1" Site (under separated submission)	
"OU(CDWRA)1" Site Area	About 116,231 m^2
"OU(CDWRA)1" Site Domestic GFA	About 255,708 m^2
GIC – Neighbourhood Elderly Centre (NEC)	About 722 m^2
GIC – 100 places Residential Care Homes for the Elderly (RCHE)	About 5,400 m^2
"OU(CDWRA)1" Site No. of Residential Units	6,825 units
Person per Flat Ratio (PPoF) (1)	2.6
"OU(CDWRA)1" Site Residential Population	17,745

Notes:

(1) Person-Per-Flat ratio (PPoF) of 2.6 with reference to the recommendation under HK2030+ (Oct 2021)

Table 3 Development Schedule Comparison

	2016 Scheme	Current Proposal
Site Area	About 38,593m^2 (excluding soy sauce factory and school site)	About 81,550m^2 (including residential zone, soy sauce factory and school site)
Proposed Usage	Shopping Mall and Hotel	Residential, School and Soy Sauce Factory
Site Design Population	1,758	8,099

3. FIRE-FIGHTING REQUIREMENTS

3.1.1 Water supply for fire-fighting service has been considered in this WSIA. Fire-fighting requirement for residential zone is 6,000m^3/day with discharge pressure of 17m head. The fire hydrant should be of standard pattern with minimum output pressure not less than 25 psi. With multiple hydrants operating at the same time, total output of not less than 4,000L/min shall last for 60 minutes. The fire-fighting requirements are summarized in **Table 4**.

Table 4 Fire-Fighting Requirements

Requirements	Minimum Values
Minimum Fresh Water Supply	6,000m^3/day
Discharge pressure	17m
Minimum output not less than 25 psi.	4,000L/min (5,760m^3/day) which lasts for an hour (i.e., 4,000×60 = 240,000L/ hour/day or 240m^3/ hour/day)

4. EXISTING WATER SUPPLY

4.1 Fresh Water Supply System

4.1.1 Layout of the existing water supply system in the vicinity of the Application Site is shown on **Figure 3**. The Application Site currently falls within the direct supply zone of Au Tau / Ngau Tam Mei Fresh Water Primary Service Reservoirs (AT/NTM FWPSRs). The application site will later fall within the supply zone of Au Tau Fresh Water Service Reservoirs (AT FWSRs) subject to the operation of shifting supply zone carried out by NTW Region.

4.1.2 A 700mm dia. distribution main is running along San Tam Road Section and a 200mm dia. water main is running along Castle Peak Road - Tam Mi in close vicinity of the Application Site.

4.1.3 An existing 80mm dia. and a 50mm dia. fresh water main were found within the Proposed Residential Development and will be diverted.

4.1.4 An existing 150mm dia. fresh water main tee from Pok Wai South Road, were found within the relocated soy sauce factory area and will be capped.

4.1.5 The existing 150mm dia. water main serving the pedestal fire hydrant PH9099 at Castle Peak Road – Tam Mi will be proposed to be tee off from extended 200mm dia. fresh water main and the fire hydrant will be retained at existing location. The proposed arrangement refer to **Figure 4**.

4.2 Salt Water Supply System

4.2.1 According to WSD record, there is no existing salt water supply system in the vicinity of the Application Site.

5. ASSESSMENT METHODOLOGY

5.1 Assessment Assumptions

5.1.1 The mean daily unit demands for various classes of consumer were assumed and adopted for this assessment. A summary table of the mean daily unit demands used for different development types is shown in **Table 5**.

Table 5 Mean Daily Unit Demands

Development Type	Fresh Water (L/Head/Day)	Flushing Water (L/Head/Day)
Residential R2	300	70
Service Trade Yuen Long	40	-
School	25	25

5.2 Water Demand of Proposed Development

5.2.1 Upon completion of the Proposed Development, the Application Site will accommodate about 3,115 flats with expected average occupancy rate of 2.6 persons / unit. **Table 6** below shows the estimation of the population of the Proposed Development.

Table 6 Summary of the Development - "R(E)" Site

Residential	
No. of Flats	3,115
Person per Flat Ratio	2.6 / unit
Residential Population	8,099
Primary School	
Student (no.)	750
Teacher (no.)	58
Kindergarten x 3	
Student (no.)	480
Teacher (no.)	60

Notes:

1. Person-Per-Flat ratio (PPoF) of 2.6 with reference to the recommendation under HK2030+ (Oct 2021).
2. According to Education Bureau Key Statistics on Primary School Pupil-Teacher Ratio of 13.0:1. The proposed primary school has 30 classrooms in total, assume with an average class size of 25.
3. According to Education Bureau Key Statistics on kindergarten Pupil-Teacher Ratio of 8.1:1. The proposed kindergarten has 8 classrooms, assume with an average class size of 20. It is proposed that there are three kindergartens in the development.
4. According to CIFSUS, the worker density for Flatted Factories' Manufacturing is assumed as 2.5 workers per GFA (in 100 m^2)

5.2.2 Estimated water demands for the Development – "R(E)" Site is summarized in **Table 7**.

Table 7 Estimated Water Demand for the Development – "R(E)" Site

			Remark
"R(E)" Site Residential Population	8,099	-	
Fresh Water Unit Demand (l/head/day)	340	-	Table 1 & 2, DI No. 1309; Included Service Trades
Fresh Water Mean Daily Demand	-	2,753.66	m^3/day
Flush Water Unit Demand (l/head/day)	70	-	Table 1, DI No. 1309
Flush Water Mean Daily Demand	-	566.93	m^3/day
Kindergarten (3 nos.) Population	480	-	Number of Students = 480
Fresh Water Unit Demand (l/head/day)	25	-	Table 1, DI No. 1309
Fresh Water Mean Daily Demand	-	12	m^3/day
Flush Water Unit Demand (l/head/day)	25	-	Table 1, DI No. 1309
Flush Water Mean Daily Demand	-	12	m^3/day
Sub Total for "R(E)" Site Fresh Water	**-**	**2,765.66**	**m^3/day**
Sub Total for "R(E)" Site Flush Water	**-**	**578.93**	**m^3/day**
Sub Total Water Demand for "R(E)" Site	**-**	**3,344.59**	**m^3/day**

			Remark
Primary School Population	750	-	Number of Students = 750
Fresh Water Unit Demand (l/head/day)	25	-	Table 1, DI No. 1309
Fresh Water Mean Daily Demand	-	18.75	m^3/day
Flushing Water Unit Demand (l/head/day)	25	-	Table 1, DI No. 1309
Flushing Water Mean Daily Demand	-	18.75	m^3/day
Total Water Demand for Primary School	**-**	**37.50 0.04**	**m^3/day MLD**
Accommodation Type	**Mean Daily Demand**		**Remark**
Soy Sauce Factory			
Total Water Demand for Soy Sauce Factory	**70.00 0.070**		**m^3/day MLD**

Note: Demand reference to water bill on June 2022

5.2.3 Estimated sub total water demands for the development – "R(E)" Site is summarized in **Table 8**.

Table 8 Sub Total Estimated Water Demand for the Development – "R(E)" Site [subject application (Application No. Y/YL-NSW/9) with comparison to 2016 Scheme]

Accommodation Type	Mean Daily Demand in 2016 Scheme	Mean Daily Demand	Remark
Sub Total Water Demand for Hotel Development	434.5	-	**m^3/day**
Sub Total Water Demand for Non-Domestic Development	1,277.8	-	**m^3/day**
Sub Total Water Demand for "R(E)" Site Residential Development	-	3,344.59	**m^3/day**
Sub Total Water Demand for Primary School	-	37.50	**m^3/day**
Sub Total Water Demand for Soy Sauce Factory	-	70.00	**m^3/day**
Total Water Demand for "R(E)" Site	**1712.3**	**3,452.09**	**m^3/day**

5.2.4 Estimated sub total water demands for the other development – "OU(CDWRA)1" Site is summarized in **Table 9**.

Table 9 Sub Total Estimated Water Demand for the Development – "OU(CDWRA)1" Site (under separate application) (Application No. Y/YL-NSW/8)

Accommodation Type	Mean Daily Demand	Remark
Total Water Demand for "OU(CDWRA)1" Site Residential Development (under separated submission)	7,275.45	**m^3/day**
Total Water Demand for GIC Facilities (under separated submission)	30.00	**m^3/day**
Total Water Demand for "OU(CDWRA)1" Site (under separated submission)	**7,305.45**	**m^3/day**

5.2.5 Estimated the total water demands for the entire in **Table 10**.

Table 10 Total Estimated Water Demand for the Entire Development

Accommodation Type	Mean Daily Demand	Remark
Total Water Demand for "R(E)" Site	**3,452.09**	**m^3/day**
Total Water Demand for "OU(CDWRA)1" Site (under separated submission)	**7,305.45**	**m^3/day**
Total Water Demand for "R(E)" Site and "OU(CDWRA)1" Site	**10,757.54** **10.76**	**m^3/day** **MLD**

Fire-Fighting	
Fire-Fighting	5,760 m^3/day

Note: Daily water demand does not include water demand for fire-fighting.

5.3 Impact on Existing Water Supply System

5.3.1 Refer to **Table 8**, the current proposed development has a larger scale of development then that in approved 2016 Scheme. Consequently, increase in water demand is envisaged for the proposed development (3,452.09m^3/day) compared to the 2016 Scheme water demand (1,712m^3/day).

5.3.2 Since no existing salt water supply system is available in the vicinity of the development, the water supply for flushing would be counted on the fresh water demands.

5.3.3 It is proposed that the existing 80mm dia. and 50mm dia. fresh water distribution main within the Proposed Development "R(E)" Site would be abandoned and diverted. Such diversion avoids the potential disturbance in water supply to a number of existing temporary sheds.

5.3.4 Currently, there is an existing 700mm dia. fresh water main along San Tam Road. The estimated water demand of the entire Proposed Development "R(E)" Site and "OU(CDWRA)1" Site is approximately 10,757.54m^3/day which is 41% of water main capacity. Therefore, the 700mm dia. fresh water main would have adequate capacity for the proposed water demand.

5.3.5 The existing 200mm dia. fresh water main along Castle Peak Road - Tam Mi will be extended by about 50m towards the access road of the "R(E)" Site. The 200mm dia. fresh water main will serve the primary school, the relocated soy sauce factory and the affected temporary sheds. The estimated water demand of the primary school and the relocated soy sauce factory are 37.50m^3/day and 70m^3/day respectively which is merely 9% of water main capacity. Therefore, the 200mm dia. fresh water main would have adequate capacity for the proposed water demand.

6. PROPOSED WATER SUPPLY SYSTEM

6.1.1 According to WSD's record plan, there is an existing 700mm dia. fresh water main underneath San Tam Road and an existing 200mm dia. fresh water main underneath Castle Park Road – Tam Mi while no salt water supply system in the vicinity of the Application Site. The demand for flushing water would be met by using fresh water. Temporary fresh water main for flushing (TMF) is applied for the development. It is recommended that connection of salt water supply system is to be provided to the Development when becomes available.

6.1.2 The existing 700mm dia. fresh water main along San Tam Road is proposed to be tee off by a 400mm dia. water main for water supply to the "R(E)" Site. The 400 mm dia. water main will be further tee of by a 300mm dia. water main for "R(E)" Site fresh water supply and a 150mm dia. water main for flushing water supply to the "R(E)" Site. The proposed arrangement is as shown in **Figure 4**. According to **Appendix 2**, about 13% capacity of the existing 700mm dia. fresh water main would be utilized.

6.1.3 The existing 200mm dia. fresh water main along Castle Peak Road - Tam Mi will be extended by about 50m towards the access road of the "R(E)" Site. The 200mm dia. fresh water main is proposed to tee off to a 80mm dia. water main for the relocated soy sauce factory fresh and flush water supply, while the primary school fresh and flush water supply will be served by another 80mm dia. water main.

According to **Appendix 3**, about 9% capacity of the existing 200mm dia. fresh water main would be utilized.

6.1.4 In order to assess the combined impact of the "R(E)" sites and "OU(CDWRA)1", the proposed parameters of both sites are included under this assessment to present the holistic picture. The estimated water demand of the entire Proposed Development "R(E)" Site and "OU(CDWRA)1" Site is approximately 10,757.54m^3/day in total, which would not exceed the capacity of the existing 700mm dia. fresh water main along San Tam Road. According to **Appendix 4**, up to 34% capacity of the existing 700mm dia. fresh water main would be utilized.

6.1.5 As mentioned in **Section 5**, the existing 80mm dia. and 50mm dia. fresh water distribution main inside the Proposed Development "R(E)" Site would be abandoned and diverted. Such diversion avoids the potential disturbance in water supply to a number of existing temporary sheds.

6.1.6 The proposed alignment of the water mains is presented in **Figure 4**. The hydraulic calculations has confirmed the adequacy of the proposed water mains and the detailed calculations is shown in **Appendix 2, 3 and 4**.

6.1.7 The connection arrangement of the proposed water works will be confirmed with WSD in the detail design stage.

7. PROPOSED FIRE-FIGHTING SYSTEM

7.1.1 The size of the proposed water main for the fire-fighting system and associated fittings will be further developed in the detailed design stage.

7.1.2 The provision of fire hydrants and fire mains is in accordance with the relevant stipulations in "Technical Circular No. 4/2010: Fire Mains and Hydrants on New Trunk Roads and Elevated Highway Structures" published by Highway Department (HyD). The average spacing of fire hydrants to at-grade trunk road shall be at a distance of 100m. The detailed arrangement will be submitted to Fire Services Department (FSD) for approval during detailed design stage.

7.1.3 The provision of fire-fighting requirements are mentioned in **Section 3**. The water supply with discharge pressure of 1.7bar (17m head) and flow of 4,000L/min that lasts for one hour will be provided.

8. CONCLUSIONS

8.1.1 According to WSD’s record plan, there is an existing 700mm dia. fresh water main underneath San Tam Road and an existing 200mm dia. fresh water main underneath Castle Park Road – Tam Mi while no salt water supply system in the vicinity of the Application Site. The demand for flushing water would be met by using fresh water. Temporary fresh water main for flushing (TMF) is required until flushing water supply to the Development becomes available.

8.1.2 The existing 80mm dia. and 50mm dia. fresh water distribution main inside the Proposed Development “R(E)” Site would be abandoned and diverted. Such diversion avoids the potential disturbance in water supply to a number of existing temporary sheds.

8.1.3 The existing 700mm dia. fresh water main along San Tam Road is proposed to be tee off by a 400mm dia. water main for water supply to the "R(E)" Site. The 400 mm dia. water main will be further tee of by a 300mm dia. water main for “R(E)” Site fresh water supply and a 150mm dia. water main for flushing water supply to the “R(E)” Site. The proposed arrangement is as shown in **Figure 4**. According to **Appendix 2**, about 13% capacity of the existing 700mm dia. fresh water main would be utilized.

8.1.4 The existing 200mm dia. fresh water main along Castle Peak Road - Tam Mi will be extended by about 50m towards the access road of “R(E)” Site. The 200mm dia. fresh water main is proposed to tee off to a 80mm dia. water main for the relocated soy sauce factory fresh and flush water supply, while the primary school fresh and flush water supply will be served by another 80mm dia. water main. About 19% capacity of the existing 200mm dia. fresh water main would be utilized.

8.1.5 In order to assess the combined impact of the "R(E)" sites and "OU(CDWRA)1", the proposed parameters of both sites are included under this assessment to present the holistic picture. The estimated water demand of the entire Proposed Development “R(E)” Site and “OU(CDWRA)1” Site is approximately 10,757.54m^3/day in total, which would not exceed the capacity of the existing 700mm dia. fresh water main along San Tam Road. Up to 41% capacity of the existing 700mm dia. fresh water main would be utilized.

8.1.6 With the proposed water supply system outlined in **Section 6**, the Development will not impose significant water supply impact to the existing water supply system.

1 INTRODUCTION

1.1 Black & Veatch Hong Kong Limited (B&V) have been commissioned to carry out engineering studies to support a Section 12A application for proposed amendments to the Approved Nam Sang Wai Outline Zoning Plan No. S/YL-NSW/8 in support of a shopping mall cum hotel development at lot 1743 CRP (Part) in DD 107, to the south of Wing Kei Tsuen, Yuen Long (the Application Site).

1.2 The Application Site is located to the south of Wing Kei Tsuen, bounded by Pok Wai South Road and Kam Tin River to the west, Castle Peak Road – Tam Mi Section to the east and Kam Tin River to the south. The Application Site occupies an area of approximately 38,593 m² (3.9 hectares). The Application Site is currently zoned as "Open Storage" ("OS"). Please refer to ***Figure I1*** for the location of the Application Site.

1.3 This planning application is proposed to rezone "OS" zone to "Commercial" ("C") zone for the development of shopping mall cum hotel (proposed shopping mall cum hotel development).

1.4 The summary of the key information for the proposed shopping mall cum hotel development is shown in ***Table I1***.

Table I1 --- Key Information of the Application Site

	Proposed Development
Site Area (m²)	about 38,593 m²
Plot Ratio	Not more than 1.5
Total Non-Domestic GFA (m²)[1] - Commercial Development [2] - Hotel[3]	Not more than 57,890 m² Not more than 38,300 m² Not more than 19,590 m²
No. of Hotel Rooms	700

1.5 This report presents the findings of studies on the following assessments to support the Planning Application:

- Water Supply Assessment
- Site Formation Assessment

[1] Excludes back of House facilities of not more than 979.5m2 (i.e. not more than 5% of the hotel GFA) which is exempted from plot ratio calculation under Building (Planning) Regulation 23A and PNAP 111 (APP-40).
[2] Including shop and services, eating place and place of entertainment.
[3] Including dining facilities, entertainment facilities, business centre, leisure and recreational facilities, function rooms, exhibition and conference facilities.

Previous approved WSIA in 2016 Scheme - Reference Only

2 WATER SUPPLY ASSESSMENT

2.1 Purpose and Methodology

2.1.1 The purpose of this assessment is to assess the feasibility of the proposed shopping mall cum hotel development in terms of fresh and flushing water supply. This assessment also presents the assessment of the capacities of existing and proposed water supply systems needed to cater for the increase of water demands .

2.1.2 The methodology adopted in the assessment is as follows:

- To estimate the increase of water demands.
- To review the existing and planned water supply systems and assess the impact on the capacities of these systems due to the above increase in water demands.
- To recommend necessary waterworks and propose alternative options.

2.2 Existing Water Supply System

2.2.1 Layout of the existing water supply system in vicinity of the Application Site is shown on ***Figure I2***. The area originally fell within the supply zone of Au Tau Water Treatment Works (WTW). After commissioning of the Ngau Tam Mei WTW, fresh water supply to the Application Site is provided by the Ngau Tam Mei WTW via a network of service reservoirs and distribution mains. The Ngau Tam Mei WTW output is 160 MLD, about 70% of the designed capacity. It is understood that provisions have been allowed for expanding the WTW to an ultimate capacity of 450 MLD in future.

2.2.2 The Application Site is located within the supply zone of the Ngau Tam Mei Fresh Water Service Reservoir (NTMWSR). The storage capacity of NTMWSR is about 40,750 cu m. The NTMWSR is located at about 4 km away to the north-east of the Application Site. A 200 mm distribution main is running along Castle Peak Road – Tam Mi in close vicinity of the Application Site. In vicinity of the Application Site, no flushing water main can be identified.

2.3 Water Demands

2.3.1 The fresh and flushing water demands generated from the proposed shopping mall cum hotel development is listed in ***Table I2***. The anticipated completion year for the proposed shopping mall cum hotel development is 2022.

Previous approved WSIA in 2016 Scheme - Reference Only

Table I2 --- Fresh and Flushing Water Demands

	Design Population	Supply	Unit Demand (ℓ/h/d)		Total Demand
			Non-domestic	Hotel	(m^3/day)
Proposed Shopping Mall cum Hotel Development	275	Fresh Water	-	1080	297.0
		Flushing Water	-	500	137.5
	805	Fresh Water	210	-	169.1
		Flushing Water	70	-	56.4
	21	Fresh Water	210	-	4.4
		Flushing Water	70	-	1.5
				Total	665.8

2.3.2 It is understood that NTMWSR will have adequate capacity to cater for an increase in water demand from the proposed shopping mall cum hotel development. Existing watermains are also considered to be adequate to meet the new demand.

2.4 Proposed Waterworks

2.4.1 The proposed connections to effect water supply to the proposed shopping mall and hotel development is shown on ***Figure I2***.

2.4.2 An existing 200 mm diameter distribution main is running along Castle Peak Road – Tam Mi. There is no flushing water main in the vicinity of the Application Site.

2.4.3 To provide water supply to the Application Site, a new 200mm diameter watermain is required to be branched off from the existing fresh water mains for supply of fresh water. As there is no public flushing water mains in the vicinity of the Application Site, it is proposed to adopt Temporary Mains Water for Flushing (TMF).

2.4.4 We recommend that further discussions to be held with WSD regarding the details of water supply connections when connection point for the Application Site is more accurately defined.

2.4.5 Since the Application Site is located at low elevation, no additional pumping facilities will be required for the water supply. However, new reticulation system within the Application Site will be required. There should be separate reticulation system for potable and flushing water supply, and with separate connection points to the existing system. We estimate that the size of the reticulation mains for potable and temporary mains flushing water supply will be about 100 to 200 mm in diameter.

Previous approved WSIA in 2016 Scheme - Reference Only

2.5 Conclusion

2.5.1 We do not foresee any insurmountable difficulties for satisfying the water demands of the proposed shopping mall cum hotel development by 2022 although further investigation and discussion with WSD will be necessary. Given the availability of funds and sufficient advance notice for WSD to organize mainlaying, both potable and flushing water supply inducing constraint on the proposed shopping mall cum hotel development is not envisaged.

3 SITE FORMATION ASSESSMENT

3.1 The Application Site

3.1.1 The Application Site was originally covered with open storage with trees

3.1.2 In general, the ground level of the Application Site ranged from approximately +3.5 mPD to +4.6 mPD.

3.1.3 Based on the results of nearby site investigation works, the subsoil profile of the Application Site comprises a layer (up to about 10 m thick) of alluvial sand and silt with some clay bands (typical Standard Penetration Test N values up to 15 blows per 300 mm), underlain by completely decomposed volcanics (CDV) down to about 45 to 60 m depth from the surface (with typical N values of around 70), where Grade III bedrock was encountered. Grade II bedrock was found at around 50 to 70 m depth.

3.2 Proposed Formation

3.2.1 The Application Site is proposed to be raised up by filling to avoid flooding. Runoff from the Application Site will be drained to the old Kam Tin River course as discussed in **Appendix G**. Taking into account the required freeboard, headloss in the local drains and cover to the drains, the proposed ground level of the proposed shopping mall cum hotel development shall be raised to a level of +7.0 mPD. The drainage impact on the adjacent areas due to the proposed site formation works at the Application Site is discussed in **Appendix G**.

3.2.2 The proposed shopping mall cum hotel development consists of basements of level about +0.5 mPD. As the Application Site is uneven, part of the site will be cut/ filled up for the site formation.

3.2.3 Depth of the excavation and filling will vary. Nonetheless, based on the existing ground levels and subject to detailed topographical survey and engineering studies at subsequent detailed design and implementation stages, the maximum depth of excavation for site formation shall not exceed 5 m and the maximum depth of filling for site formation shall not exceed 4 m.

on 22/05/2015

Attachment 2

Table I2 of the Water Impact Assessment

Previous approved WSIA in 2016 Scheme - Reference Only

Table I2 --- Fresh and Flushing Water Demands

	Design Population	Supply	Unit Demand (ℓ/h/d)		Total Demand
			Non-domestic	Hotel	(m^3/day)
Proposed Shopping Mall cum Hotel Development	275	Fresh Water	-	1080	297.0
		Flushing Water	-	500	137.5
	805	Fresh Water	1080	-	869.4
		Flushing Water	500	-	402.5
	21	Fresh Water	210	-	4.4
		Flushing Water	70	-	1.5
				Total	1712.3

Appendix 2

Hydraulic Calculation for Existing Water Mains underneath San Tam Road

Annex 2

Hydraulic Calculation For Existing water mains located underneath San Tam Road

Estimated Fresh and Flush Water Demands for Entire Development (R(E) Site) 3,452.09 m^3/day

Hydraulic Calculation for Existing Fresh Water Supply System to Entire Development (R(E) Site)

The required flow rate, Q_f for the entire development is:	3,452	m^3/day
	0.040	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3. Hence, the required peak flow rate for the development Q_{fp} is:	0.120	m^3/s
Diameter of existing water main	700	mm
Cross Section Area (Adopted Internal Diameter 682mm)	0.365	m^2
The velocity limit of the existing water main is:	2.5	m/s
The flow rate of the existing water main is	0.913	m^3/s
Hence, the utilization of the existing water main occupied by the development site is:	13	%

Therefore, the Proposed Development would not post a significent impact to the existing water main which located underneath San Tam Road.

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. The flow limit adopted is referenced from DI1309.
3. Internal diameter of water main is adopted on cross section calculation for hydarulic checking.

Annex 2

Hydraulic Calculation For Proposed water mains located underneath San Tam Road

Estimated Fresh and Flush Water Demands for Entire Development (R(E) Site)	3,452.09	m^3/day

Hydraulic Calculation for Proposed Fresh Water Supply System to R(E) Site

The required flow rate, Q_f for the R(E) Site is:	3,452	m^3/day
	0.040	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3.		
Hence, the required peak flow rate for the development Q_{fp} is:	0.120	m^3/s
Pipe size of proposed water main	400	mm
Cross Section Area (Adopted Internal Diameter 360mm)	0.102	m^2
The velocity of the proposed water main is:	1.176	m/s
Therefore, the capacity checking of the proposed pipe size 400 dia. is :	OK	

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. Internal diameter of water main is adopted on cross section calculation for hydarulic checking.

Annex 2

Hydraulic Calculation For Existing water mains located underneath San Tam Road

Estimated Fresh Water Demands for R(E) Site 2,765.66 m^3/day

Hydraulic Calculation for Proposed Fresh Water Supply System to R(E) Site

The required flow rate, Q_f for the R(E) Site is:	2,766	m^3/day
	0.032	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3.		
Hence, the required peak flow rate for the development Q_{fp} is:	0.096	m^3/s
Pipe size of proposed water main	300	mm
Cross Section Area (Adopted Internal Diameter 282mm)	0.062	m^2
The velocity of the proposed water main is:	1.548	m/s

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. Internal diameter of water main is adopted on cross section calculation for hydarulic checking.

Annex 2
Hydraulic Calculation For Existing water mains located underneath San Tam Road

Hydraulic Calculation for Proposed Flush Water Supply System to R(E) Site

The required flow rate, Q_f for the R(E) Site is:	578.93	m^3/day
	0.007	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for flushing water distribution mains is 2.		
Hence, the required peak flow rate for the development Q_{fp} is:	0.013	m^3/s
Diameter of proposed water main	150	mm
Cross Section Area (Adopted Internal Diameter 138mm)	0.015	m^2
The velocity of the proposed water main is:	0.867	m/s
Therefore, the capacity checking of the proposed pipe size 150 dia. is :	OK	

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. Internal diameter of water main is adopted on cross section calculation for hydarulic checking.

Appendix 3

Hydraulic Calculation for Existing Watermains located underneath Castle Peak Road - Tam Mi

Annex 3

Hydraulic Calculation For Existing water mains located underneath Castle Peak Road - Tam Mi

Estimated Fresh and Flush Water Demands for Soy Sauce Factory and Primary School	107.50	m^3/day

Hydraulic Calculation for Existing Fresh Water Supply System to Soy Sauce Factory and Primary School

The required flow rate, Q_f for Soy Sauce Factory and Primary School is:	108	m^3/day
	0.0012	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3.		
Hence, the required peak flow rate for the development Q_{fp} is:	0.0036	m^3/s
Diameter of existing water main	200	mm
Cross Section Area (Adopted Internal Diamter 189mm)	0.028	m^2
It was assumed that the velocity of the existing water main is:	1.5	m/s
The flow rate of the existing water main is	0.042	m^3/s
Hence, the percentage of the existing water main occupied by the development site is:	9	%

Therefore, the Proposed Development would not post a significent impact to the existing water main which located underneath Castle Peak Road - Tam Mi.

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. The peak velocity for pipe size below 300mm dia. under peak flow condition shall be less than 1.5 m/s.
3. Internal diameter of water main is adopted on cross section calculation for hydraulic checking.

Annex 3

Hydraulic Calculation For Existing water mains located underneath Castle Peak Road - Tam Mi

Estimated Fresh and Flush Water Demands for Soy Sauce Factory 70.00 m^3/day

Fresh and Flush Water Demand for Proposed Fresh and Flush Water System to the Soy Sauce Factory

The fresh and flush water demand for existing Soy Sauce Factory is referenced from water bill in May 2022.

The required flow rate, Q_f for the Soy Sauce Factory is:	70	m^3/day
	0.0008	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3. Hence, the required peak flow rate for the development Q_{fp} is:	0.0024	m^3/s
Diameter of proposed water main for Soy Sauce Factory	80	mm
Cross Section Area	0.005	m^2
It was assumed that the velocity of the existing water main is:	1	m/s
The flow rate of the existing water main is	0.005	m^3/s
Hence, the percentage of the proposed water main occupied by the soy sauce factory is:	48	%

Hydraulic Calculation for Existing Fresh and Flush Water Supply System to Soy Sauce Factory

The required flow rate, Q_f for the Soy Sauce Factory is:	70	m^3/day
	0.0008	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3. Hence, the required peak flow rate for the development Q_{fp} is:	0.0024	m^3/s
Diameter of existing (extend) water main	200	mm
Cross Section Area (Adopted Internal Diamter 189mm)	0.028	m^2
It was assumed that the velocity of the existing (extend) water main is:	1.5	m/s
The flow rate of the existing (extend) water main is	0.042	m^3/s
Hence, the percentage of the existing (extend) water main occupied by the soy sauce factory is:	5.7	%

Therefore, the soy sauce factory would not post a significent impact to the existing water main which located underneath Castle Peak Road - Tam Mi.

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. The peak velocity for pipe size below 300mm dia. under peak flow condition shall be less than 1.5 m/s.
3. The fresh and flush water demand for existing Soy Sauce Factory is referenced from water bill in May 2022.
4. Internal diameter of water main is adopted on cross section calculation for hydraulic checking.

Annex 3

Hydraulic Calculation For Existing water mains located underneath Castle Peak Road - Tam Mi

Estimated Fresh and Flush Water Demands for Primary School	37.50	m^3/day

Hydraulic Calculation for Existing Fresh and Flush Water Supply System to Primary School

The required flow rate, Q_f for the Primary School is:	38	m^3/day
	0.0004	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3. Hence, the required peak flow rate for the development Q_{fp} is:	0.0012	m^3/s
Diameter of existing (extend) water main	200	mm
Cross Section Area (Adopted Internal Diamter 189mm)	0.028	m^2
It was assumed that the velocity of the existing (extend) water main is:	1.5	m/s
The flow rate of the existing (extend) water main is	0.042	m^3/s
Hence, the percentage of the existing water main occupied by the primary school is:	2.9	%

Therefore, the primary school would not post a significent impact to the existing water main which located underneath Castle Peak Road - Tam Mi.

Hydraulic Calculation for Proposed Fresh and Flush Water Supply System to Primary School

The required flow rate, Q_f for the Primary School is:	38	m^3/day
	0.00043	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3. Hence, the required peak flow rate for the development Q_{fp} is:	0.0013	m^3/s
Diameter of proposed water main	80	mm
Cross Section Area	0.005	m^2
It was assumed that the velocity of the proposed water main is:	1	m/s
The flow rate of the proposed water main is	0.005	m^3/s
Hence, the percentage of the proposed water main occupied by the primary school is:	26	%

Notes:

1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. The peak velocity for pipe size below 300mm dia. under peak flow condition shall be less than 1.5 m/s.
3. Internal diameter of water main is adopted on cross section calculation for hydraulic checking.

Appendix 4

Hydraulic Calculation for Existing Water Mains underneath San Tam Road

Annex 4
Hydraulic Calculation For Existing water mains located underneath San Tam Road

Estimated Fresh Water Demands for R(E) Site, OU(CDWRA)1 Site, primary school, soy sauce factory and GIC facilities	10,757.54	m^3/day

Hydraulic Calculation for Existing Fresh Water Supply System to the Entire Development

The required flow rate, Q_f for the entire development is:	10,757.54	m^3/day
	0.125	m^3/s
With reference to WSD's Departmental Instruction No. 1309, the peak factor for fresh water distribution mains is 3.		
Hence, the required peak flow rate for the development Q_{fp} is:	0.375	m^3/s
Diameter of existing water main	700	mm
Cross Section Area (Adopted Internal Diamter 682m)	0.365	m^2
It was assumed that the velocity of the existing water main is:	2.5	m/s
The flow rate of the existing water main is	0.91	m^3/s
Hence, the percentage of the existing water main occupied by the development site is:	41	%

Therefore, the Proposed Development would not post a significent impact to the existing water main which located underneath San Tam Road.

Notes:
1. According to Manual of Mainlaying Practice 2012 Edition, the maximum flow velocity under peak flow for both pumping mains and distribution mains should be less than 3 m/s.
2. The flow limit adopted is referenced from DI1309.
3. Internal diameter of water main is adopted on cross section calculation for hydraulic checking.

1. INTRODUCTION

1.1.1 This Ecological Impact Assessment (EcoIA) is prepared for the planning application of a proposed development to the west of Castle Peak Road - Tam Mi Section, Yuen Long. The Application Site is about 8.15ha and currently falls within “Industrial (Group D)” (“I(D)”) and “Open Storage” (“OS”) zones under the Nam Sang Wai Outline Zoning Plan (OZP) No. S/YL-NSW/8. The Applicant proposed to rezone the Application Site from "I(D)" and "OS" zones to "Residential (Group E)" ("R(E)") zone in support of a comprehensive development, reserved school site and relocated soy sauce factory (name "R(E)" Site).

1.1.2 The Application Site is a developed area and currently occupied by an existing soy sauce factory and open storage fields. The proposed Project includes a residential portion, a reserved school site and a portion for relocated soy sauce factory. The proposed residential development would involve relocation of the existing soy sauce factory in the I(D) zone to the southern part of the proposed R(E) site. There is another planning application for rezoning the "Other Specified Uses (Comprehensive Development to Include Wetland Restoration Area)" zone ("OU(CDWRA)") to "OU(CDWRA)1" zone for comprehensive development to the north of the Application Site and is submitted under a separate submission.

1.1.3 This EcoIA is prepared to support the subject application, and comprises two major components, i.e., ecological baseline information and impact assessment. The ecological baseline information for impact assessment was established by both literature review and ecological surveys. As the Application Site is within the Wetland Buffer Area (WBA), a 12-month ecological survey was conducted between Nov 2019 and Oct 2020, to fulfill the requirements stipulated in the Town Planning Board Planning Guideline No. 12C. Other than the 12-month ecological survey, specific flight-line surveys for breeding ardeids from Tung Shing Lane Egretry were also conducted in 2019 and 2020, while another survey for a new egretry at Kam Po Road was conducted in 2021.

2. LEGISLATION & GUIDELINES

2.1 General

2.1.1 The Hong Kong Special Administrative Region ordinances and associated regulations/guidelines relevant to the present EcoIA include the following:

- Forests and Countryside Ordinance (Cap. 96) and its subsidiary legislation, the Forestry Regulations (Cap. 96A);
- Wild Animals Protection Ordinance (Cap. 170);
- Environmental Impact Assessment Ordinance (Cap. 499) and the associated Technical Memorandum (TM-EIAO); and
- Protection of Endangered Species of Animals and Plants Ordinance (Cap. 586) and its subsidiary legislation;

_Hlk316631036

2.1.2 The present EcoIA makes reference to the following guidelines and standards:

- Hong Kong Planning Standards and Guidelines (HKPSG) Chapter 10, "Conservation";
- PELB Technical Circular 1/97 / Works Branch Technical Circular 4/97,"Guidelines for Implementing the Policy on Off-site Ecological Mitigation Measures";
- EIAO Guidance Note No. 6/2010 - Some Observations on Ecological Assessment from the Environmental Impact Assessment Ordinance Perspective;
- EIAO Guidance Note No. 7/2010 – Ecological Baseline Survey for Ecological Assessment;
- EIAO Guidance Note No. 10/2010 – Methodologies for Terrestrial and Freshwater Ecological Baseline Surveys; and

2.1.3 This EcoIA also makes reference to the following Mainland legislation:

- List of State Protected Wild Animals, promulgated by the State Council 國家重點保護野生動物名錄;
- List of State Protected Wild Plants, promulgated by the State Council 國家重點保護野生植物名錄;

2.1.4 Other international conventions and guidelines that are relevant to this EcoIA include the followings:

- Convention on International Trade in Endangered Species of Wild Fauna and Flora ("CITES"). This Convention regulates international trade in animal and plant species considered to be at risk from such trade. The main categories of species relevant to Hong Kong are Appendices I and II. Species listed in Appendix I are species threatened with extinction that are or may be affected by trade; species listed in Appendix II are those that, while not necessarily under current threat of extinction, may become threatened unless trade is subject to strict regulation. Hong Kong's obligations under this Convention are enforced via the Protection of Endangered Species of Animals and Plants Ordinance.
- International Union for Conservation of Nature ("IUCN"): the World Conservation Union maintains, through its Species Survival Commission, a Red List of globally threatened species of wild plants and animals (see http://www.redlist.org). The Red List is considered the authoritative publication to classify species as critically endangered, endangered, vulnerable, or lower-risk.

2.2 Criteria of Evaluating Species of Conservation Importance

_Hlk316631036

2.2.1 Species of flora and fauna with conservation importance were given special attention. In accordance with Table 3, Annex 8 of the TM-EIAO, the ecological value of species was assessed in terms of protection status, distribution, and rarity. Flora or fauna species protected by the following laws/regulations, listed under the following conventions and/or endemic to Hong Kong, were considered to be species of conservation importance. However, this excludes exotic weeds, escaped cultivars or captive species, vagrants and introduced species which have lower ecological value. Species which are classified by IUCN as Near Threatened (NT), Least Concern (LC), Data Deficient (DD), or Not Evaluated (NE), and not covered by any other laws/regulations/conventions are not considered of conservation importance in the present study.

- The International Union for Conservation of Nature and Natural Resources (IUCN) Red List of Threatened Species;
- China Plant Red Data Book;
- China Species Red List;
- China Red Data Book of Endangered Animals;
- Category I or II protected species in mainland China;
- Threatened Species List of China's Higher Plants (Qin *et al*. 2017);
- Red List of China's Vertebrates;
- The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES);
- Forestry Regulations (Cap. 96A) which are subsidiary legislation of the Forests and Countryside Ordinance (Cap. 96);
- Wild Animals Protection Ordinance (Cap. 170) (except birds as all wild birds are protected under the ordinance but their conservation importance is not equal);
- Protection of Endangered Species of Animals and Plants Ordinance (Cap. 586);
- PRC Wild Animal Protection Law;
- Plant species considered 'Rare' or 'Very Rare' listed by Corlett *et al*. (2000), or regarded as rare by Yip *et al.* (2010) where applicable; and
- Fauna species considered of concern in Fellowes *et al*. (2002).

3. METHODOLOGY

3.1 Application Site and Study Area

3.1.1 The Application Site is situated to the east of Kam Tin River and to the west of Castle Peak Road – Tam Mi, Yuen Long (**Figure 1**). It is located at the periphery of the Wetland Buffer Area (WBA) as defined under Town Planning Board Guideline No. 12C (TPB Guideline No. 12C) "Application for Developments within Deep Bay Area" (**Figure 2a**), which is less ecologically sensitive than Wetland Conservation Area (WCA). It is also located outside the "Priority Site for Enhanced Conservation - Deep Bay Wetland outside Ramsar Site".

3.1.2 The Application Site is a developed area and currently occupied by an

_Hlk316631036

existing soy sauce factory (still in operation) and open storage area. Due to its close proximity to disturbed habitats (i.e., wasteland and developed area such as highways), the existing environment within and near the Application Site has endured a certain level of disturbance from human activities in the vicinity.

3.1.3 When the ecological survey was planned, a separate ecological study for the area currently zoned as OU(CDWRA) to the north of the Application Site was also being planned. Due to the close proximity of the two studies and avoiding inconsistency on ecological baseline, the ecological surveys of the two studies was combined and conducted together, with the Study Area covering a 500m distance from the two areas (**Figure 1**). The Study Area stated in the present EcoIA includes both the 500m distance from the Application Site and the area within the Application Site unless stated otherwise.

3.2 Literature Review

3.2.1 The following available literature which covers the Study Area and in the vicinity were reviewed:

- EIA-004/1998 Yuen Long Bypass Floodway - Feasibility Study
- EIA-063/2002 – Yuen Long and Kam Tin Sewerage and Sewage Disposal Stage 1 Packages 1A-1T and 1B-1T - Kam Tin Trunk Sewerage Phase I and II
- EIA-159/2008 Construction of Cycle Tracks and the associated Supporting Facilities from Sha Po Tsuen to Shek Sheung River (Mott MacDonald 2013)
- EIA-269/2021 Yuen Long Barrage Scheme
- Planning application No. A/YL-NSW/223 (Withdrawn)
- Planning application No. Y/YL-NSW/4
- Planning application No. A/YL-NSW/224
- Planning application No. A/YL-NSW/233

- Hong Kong Biodiversity – Newsletter of the Department of Agriculture, Fisheries and Conservation
- AFCD publications
- A new species of firefly from Hong Kong – *Pteroptyx maipo* Ballantyne, 2011 (Yiu 2011)
- *Pteroptyx maipo* Ballantyne, a new species of bent-winged firefly (*Coleoptera: Lampyridae*) from Hong Kong, and its relevance to firefly biology and conservation (Ballantyne *et al*. 2011)

3.3 Ecological Survey Methodology

3.3.1 The baseline ecological surveys covered a period of 12 months from November 2019 to October 2020, in order to fulfill the requirements stipulated in the Town Planning Board Planning Guideline No. 12C. The surveys included habitat mapping, vegetation, mammal, bird, herpetofauna, butterfly, odonate, firefly, and aquatic fauna.

3.3.2 Besides, specific surveys on flight behavior of breeding ardeids at Tung Shing Lane Egretry were conducted in 2019 and 2020 (between April and July in both years). In 2021, Tung Sing Lane Egretry was abandoned and a new egretry was found at Kam Po Road (over 2.5 km to the southeast of the Application Site), additional surveys were thus conducted between May and August 2021 to record the flight behavior of ardeids at the new egretry. Survey methodology of each survey item is described in the following sections.

Habitat and Vegetation Survey

3.3.3 Habitats within the Study Area were mapped based on aerial photos and ground truthing. Walk-over surveys were conducted at representative areas of each habitat type. Vascular plant species in each habitat type were identified (with the aid of binoculars when necessary) and their relative abundance were recorded, with special attention to rare and protected species. Color photographs were taken of all habitats encountered on site and of ecological features of special importance. Habitat map of the Study Area was produced at suitable scale using GIS software. Nomenclature of vascular plant species follows Hong Kong Plant Database retrieved from website of Hong Kong Herbarium (Hong Kong Herbarium 2021), whilst their rarity in Hong Kong follows Corlett *et al*. (2000) and Yip *et al*. (2010) where applicable.

Mammal Survey

_Hlk316631036

3.3.4 Mammals within the Study Area were surveyed by active search. All sightings, tracks, and signs of mammals found within the Study Area were recorded. As some mammal species are nocturnal, night surveys were also conducted with spotlight. Nomenclature of mammal followed Agriculture, Fisheries and Conservation Department (AFCD 2021).

Bird and Flight-line Survey

3.3.5 Birds within the Study Area were surveyed quantitatively using transect count method (**Figure 2a**). All birds seen or heard were identified and their abundance recorded by habitat. Birds encountered outside survey transects but within the Study Area were also recorded in order to produce a complete species list. Signs of breeding (e.g. nests, recently fledged juveniles) were also recorded. As some birds (e.g., owls, nightjars) are nocturnal, night surveys were conducted. Nocturnal birds were identified by active searching using spot-light and by their calls. Ornithological nomenclature in this report followed AFCD 2021.

3.3.6 Tung Shing Lane Egretry is located about 850m to the southwest of the Application Site (**Figure 2b**). Flight path surveys were conducted simultaneously at various vantage points (**Figure 2b**) to determine the flight behaviour of breeding ardeid from the egretry within ardeid breeding season (between April and July) in 2019 and 2020. The flight path surveys were undertaken continuously for 1.5 hours before sunset (~17:00 – 18:30) and/or in the morning (8:00 – 9:30). The flight paths of ardeid individuals taking off from Tung Shing Lane Egretry were recorded by making reference to land features. The focus was on birds carrying out long-distance flights to and from the egretry. Flights involving short hops from point to point (such as among different trees) were not considered as flight paths.

3.3.7 Tung Shing Lane Egretry was abandoned in 2021. However, a new egretry at Kam Po Road, which is over 2.5km to the southeast of the Application Site, was reported in 2021 (**Figure 2c**). Flight path surveys for the new egretry were therefore conducted between May and August 2021. Five vantage points including near the new egretry and along Kam Tin River were adopted simultaneously for the survey.

3.3.8 Three dry season flight path surveys were conducted at the vantage points within the Application Site and at Kam Tin River Drainage Channel between December 2019 and February 2020. The flight path surveys were undertaken continuously for 1.5 hours before sunset from the same vantage points for Tung Shing Lane Egretry (except the one to the south of Yuen Long Highway) (**Figure 2b**). Particular attention was paid to large-sized species such as waterbirds and also other species of conservation importance.

3.3.9 The ardeid night roost survey at Kam Tin River near Yuen Long Highway was surveyed at evening in December 2019, February 2020, April 2020, June 2020, August 2020 and October 2020, with number, species, and the time when the ardeids returned to the roost recorded. Survey was commenced one hour before sunset and conducted near the night roost

_Hlk316631036

(**Figure 2b**).

3.3.10 Evening surveys were conducted to investigate the number and distribution of Great Cormorants roosting at Nam Sang Wai. Surveys were conducted three times in between December 2019 and February 2020. All surveys started approximately one hour before sunset to permit a count of all roosting sites before it became too dark to accurately count the number of birds, although care was taken to avoid underestimating numbers on days when birds were still arriving at the start of the count. During the surveys, all groups of trees providing suitable conditions for roosting cormorants were observed and total number of birds seen in each group of trees was recorded.

Herpetofauna Survey

3.3.11 Herpetofauna within the Study Area were surveyed by active search. All reptiles and amphibians sighted were recorded. As herpetofauna are mostly nocturnal, night surveys were carried out. Potential microhabitats of herpetofauna such as wall, fallen logs, litter, channel/nullah, fishpond margins, underneath of stones or other materials, artificial container (e.g., pots) were searched during surveys to locate cryptic or secretive herpetofauna species. Amphibians were also identified by their calls during night surveys. Nomenclature of amphibian followed AFCD (2021).

Butterfly and Odonata Survey

3.3.12 Dragonflies and butterflies within the Study Area were surveyed quantitatively using transect method (**Figure 2a**). Dragonflies and butterflies observed were identified and their abundance recorded by habitat. Dragonflies and butterflies encountered outside survey transects but within the Study Area were also recorded in order to produce a complete species list. Nomenclature of butterfly and odonate followed AFCD (2021).

Firefly Survey

3.3.13 Firefly surveys were conducted monthly between April and October 2020 mainly following the land-based transects (**Figure 2a**). The firefly surveys were started shortly after sunset and continued until 90 minutes after sunset when the fireflies were the most active. During the surveys, any adult fireflies observed were identified to the species level, where possible. The abundance and distribution of fireflies, in particular Bent-winged Firefly, were recorded.

Aquatic Fauna Survey

3.3.14 Aquatic fauna (such as fishes and invertebrates) at 7 sampling locations (**Figure 2a**) within the Study Area were studied by active searching and direct observation. All aquatic fauna found were identified to the lowest possible taxonomic level with their relative abundance recorded, and the nomenclature for fish followed Lee *et al*. (2004), while those for the macro-invertebrates followed Dudgeon (2003).

3.3.15 Terrestrial fauna survey transects along with aquatic sampling locations (i.e. 1, 2, 3 4, 5, 6, 7), are shown in **Figure 2a**. While the vantage points of flight behavior and roosting of ardeids are shown in **Figure 2b** and **2c**.

_Hlk316631036

Survey schedule of the 12-month survey programme is shown in **Table 3.1**.

Table 3.1 Ecological Survey Programme

Survey	2019		2020									
	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct
Habitat and vegetation			D					D

*Flight-line surveys for Tung Shing Lane Egretry were also conducted in the breeding season of 2019 and 2020 (from April to July of both years), and for the new egretry at Kam Po Road were conducted between May and August 2021

3.3.16 Survey data is shown in **Appendix A** to **Appendix H** of this report. Data recorded within the entire Study Area (including Application Site) are presented by habitats, while those recorded within the Application Site are also shown in a separate column for easy reference.

_Hlk316631036

4. ECOLOGICAL BASELINE CONDITION

4.1 Literature Review

4.1.1 The Application Site is located at the periphery of the Wetland Buffer Area (WBA) and outside the Wetland Conservation Area (WCA) (**Figure 2a**).

4.1.2 WCA comprises the existing and contiguous, active or abandoned fishponds in the Deep Bay Area. According to the Town Planning Board Guidelines for Application for Developments within Deep Bay Area, the planning intention of WCA is to conserve the ecological value of the fishponds which form an integral part of the wetland ecosystem in the Deep Bay Area. A buffer area of about 500 m along the landward boundary of the WCA is designated as WBA. The planning intention of WBA is to protect the ecological integrity of the fishponds and wetlands within the WCA and to prevent development that would have a negative off-site impact on the ecological value of those fishponds.

4.1.3 According to Town Planning Board Guidelines for Application for Developments within Deep Bay Area (TPB PG-NO. 12C), "within the WBA, for development or redevelopment which requires planning permission from the Board, an ecological impact assessment would also need to be submitted. Development/redevelopment which may have negative impacts on the ecological value of the WCA would not be supported by the Board, unless the ecological impact assessment can demonstrate that the negative impacts could be mitigated through positive measures."

4.1.4 **Priority Site for Enhanced Conservation: Deep Bay Wetland outside Ramsar Site** – It covers about 1,011.6 ha in the northwest New Territories. It includes a large number of fishponds around the Ramsar Site in Lin Barn Tsuen and Ma Tso Lung areas, as well as a section of the Kam Tin River. Existing land uses are mainly commercially managed fishponds. The Application Site is outside the Priority Site but part of the Study Area lies within the boundary of Priority Site (**Figure 1**).

4.1.5 **Conservation Area** - Fishponds to the north of the Application Site within WCA are also zoned as "Conservation Area". The zoning is to protect and retain the existing natural landscape, ecological or topographical features of the area for conservation, education and research purposes. According to the planning intention, there is a general presumption against development in this zone. In general, only developments that are needed to support the conservation of the existing natural landscape or scenic quality of the area or the essential infrastructure project with overriding public interest may be permitted (**Figure 1**).

4.1.6 **Tung Shing Lane Egretry** – It is the nearest egretry, which is located at approximately 850m southwest from the Application Site. However, this egretry is abandoned currently. This egretry was first reported in 2001. Tung Shing Lane (TSL) Egretry is located at several trees on fishpond bunds and near village houses in Tung Shing Lei village and was the third

_Hlk316631036

largest egretry in 2018 census, with 84 nests which accounting for 7.8% of the total number of the nests in Hong Kong in that year (Anon 2019). However, hard pruning of trees within the nesting area in previous years was noted in the egretry in May 2019, while Typhoon Mangkhut resulted in thinning of vegetation in the same egretry (Anon 2020). According to the census data provided by Hong Kong Bird Watching Society (HKBWS), the number of ardeid nests in this egretry decreased by 22.6% from 2018 to 2019 (Anon 2020). Two ardeid species, Little Egret and Chinese Pond Heron, were recorded nesting in this egretry between 2015 and 2020 **(Table 4.1)**. However, this egretry was abandoned in 2021.

Table 4.1 Nesting Populations of Ardeid from Tung Shing Lane Egretry between 2015 and 2020 (data extracted from Anon. 2015, 2016, 2017, 2018, 2020a and 2020b.)

Year	Little Egret	Chinese Pond Heron	Total nests (% of total in HK)
2015	30	47	77 (5.4%)
2016	20	41	61 (4.9%)
2017	21	61	82 (6.6%)
2018	49	35	84 (7.8%)
2019	27	38	65 (4.0%)
2020	16	20	36 (1.9%)

4.1.7 **Flight Behavior of Breeding Ardeids** – Among the relevant studies, the flight paths of the TSL Egretry were studied in detail or mapped in the EcoIA for Planning Application No. Y/YL-NSW/3, Y/YL-NSW/4, A/YL-NSW/241, A/YL-NSW/224, A/YL-NSW/233, A/YL-NSW/242, A/YL-NSW/274 and A/YL-NSW/275.

4.1.8 The EcoIA for Planning Application Y/YL-NSW/3, Y/YL-NSW/4, A/YL-NSW/241 and A/YL-NSW/233 adopted the same set of flight path data, which was conducted between May 2013 and June 2013. According to the EcoIA for the approved Planning Application No. A/YL-NSW/233, approximately 70% of all recorded birds from TSL Egretry flew towards north, whilst 30% flew towards east and west. To the north of Yuen Long Highway, six major flight-lines (a total of 74 individuals of bird) were recorded. However, none of those flew over the present Application Site.

4.1.9 A verification survey was conducted in July and August 2018 for the approved Planning Application No. A/YL-NSW/274, the results showed that the ardeids from TSL Egretry still mainly flew a general northward direction (i.e. flying across the Yuen Long Highway and the Yuen Long Bypass Floodway) with occasional individuals landing at the ponds in front of the egretry or flying westward to Yuen Long Town direction. The findings were consistent with those reported from the previous survey in 2013.

4.1.10 **Great Cormorant Roost** – A number of Great Cormorant Roosts at Nam Sang Wai were identified. The cormorant roosts were mainly in exotic trees such as *Eucalyptus* sp. The proposed development is highly unlikely

_Hlk316631036

to impose significant impacts on the roosting site, which lies beyond 500m from the Application Site. The Great Cormorant roost is also separated from the Application Site by a section of Kam Tin River Drainage Channel and other habitats.

4.1.11 **Kam Tin River Main Drainage Channel (KTMDC)** – It is located to the west of the Application Site. In order to avoid flooding affecting the development at Yuen Long south, the Government implemented this large river training project along the original Kam Tin River, which included straightening a section of original Kam Tin River lying to the west of Castle Peak Road, breaking and merging fishponds in Nam Sang Wai with Shan Pui River before entering Inner Deep Bay. Kam Tin River meets Shan Pui River at the northern tip of Nam Sang Wai and eventually drains into the Deep Bay which is about 1km further north. The channel has a trapezoidal cross-section, and the further downstream section has a rubble protected embankment. Many mangroves were planted at the margin and the lower course of Kam Tin River Main Drainage Channel. The channel now also provides foraging opportunities for waterbirds. Night roosts of ardeids are located at about 250m to the south and southwest of the Application Site at Kam Tin River Main Drainage Channel **(Figure 2b).**

4.1.12 **Yuen Long Bypass Floodway Mitigation Wetland** – It was created to compensate for the loss of fishponds and agricultural land due to the Yuen Long Bypass Floodway project. A piece of compensation wetland was created from three abandoned fishponds to provide wetland habitat to birds, amphibians and dragonflies. A total of about 260 plant, 159 birds, 110 butterflies, 40 odonates, 31 herpetofauna and 16 mammal species were recorded in the monitoring programme of AFCD since 2006 (AFCD, pers. comm.). Breeding of Little Grebe *Tachybaptus ruficollis* and White-breasted Waterhen *Amaurornis phoenicurus* were observed in the mitigation wetland. This Yuen Long Bypass Floodway Mitigation Wetland is about 200m to the west from the Application Site.

4.1.13 **Firefly Habitat in Nam Sang Wai** – Mai Po Bent-winged Firefly *Pteroptyx maipo* was recorded, together with another area in Lut Chau, in Nam Sang Wai during the ecological survey for the Planning Application "Proposed Comprehensive Development with Wetland Enhancement, Public Park and Residential Development, Nam Sang Wai and Lut Chau" (Planning Application No. A/YL-NSW/242). The species was recorded at the mangroves surrounding Lut Chau and along the Kam Tin River and at the southern end of NSW. Since its first description in 2011, within Hong Kong, this species is currently known only from the Deep Bay area, and appears to be restricted to intertidal grassland and mangrove habitats. The reported location of this species in the southwestern corner of Nam Sang Wai is to the west of the Application Site and lies more than 700m from the Application Site, near the junction of the Kam Tin River Meander and the Shan Pui River Drainage Channel.

4.1.14 Other recognised sites of conservation importance in Northwest New Territories include the Mai Po Inner Deep Bay Ramsar Site, Mai Po Nature

_Hlk316631036

Reserve, Mai Po Marshes SSSI, Mai Po Village SSSI Egretry, which are all away from the Study Area.

4.1.15 **Species of Conservation Importance** - Species of conservation importance reported from literature were reviewed. Among those studies, the EIA "Construction of Cycle Tracks and the associated Supporting Facilities from Sha Po Tsuen to Shek Sheung River" (AEIAR-133/2009), EcoIA for Planning Application No. A/YL-NSW/275, EcoIA for Planning Application No. Y/YL-NSW/3, EcoIA for Planning Application No. A/YL-NSW/241, EcoIA for Planning Application No. A/YL-NSW/242 (mainly focused on Kam Tin River), EcoIA for Planning Application No. A/YL-KTN/268 and EcoIA for Planning Application No. A/YL-NSW/274 were considered most relevant as their study areas partially overlapped with the Study Area of the present study, and also relatively updated (EcoIA for No. A/YL-NSW/274 has also incorporated survey data from EcoIA for No. Y/YL NSW/4). The ecological surveys of these previous studies were conducted between November 2016 and March 2017, and January 2011, August 2018 and November 2019 and June 2020 respectively.

4.1.16 Among the relevant studies, 108 species of conservation importance were recorded. The species of conservation importance reported by these EcoIA are presented in **Table 4.2**.

Table 4.2 Species of Conservation Importance Previously Recorded in Studies Near the Study Area

Common name/Chinese Name	Scientific name	Source of Information								Protection status / Conservation level [2 3 4 5 6 7 8 9 10 11]	Distribution and Rarity [1]
		EIA-159/ 2008	A/YL-NSW/ 275	A/YL-NSW/ 274	A/YL-NSW/ 242	A/YL-NSW/ 241	Y/YL-NSW/ 4	Y/YL-NSW/ 3	AFCD mitigation wetland monitoring		
Plant											
Prince's Feather 紅蓼	*Persicaria orientalis*			✓						-	Very rare. Found in Sha Po, Yuen Long.
Bird (All birds are protected under Cap. 170)											
Eurasian Wigeon 赤頸鴨	*Mareca Penelope*	✓	✓	✓	✓	✓	✓	✓	✓	Fellowes *et al.* (2002): RC	Common winter visitor. Found in Deep Bay area, Tai Lam Chung.
Northern Shoveler 琵嘴鴨	*Spatula clypeata*	✓	✓	✓	✓	✓	✓	✓	✓	Fellowes *et al.* (2002): RC	Abundant winter visitor. Found in Deep Bay area.
Northern Pintail 針尾鴨	*Anas acuta*	✓	✓	✓	✓	✓	✓	✓	✓	Fellowes *et al.* (2002): RC	Abundant winter visitor. Found in Deep Bay area, Shuen Wan, Long Valley, Kam Tin.
Eurasian Teal 綠翅鴨	*Anas crecca*	✓	✓	✓	✓	✓	✓	✓	✓	Fellowes *et al.* (2002): RC	Common winter visitor. Found in Deep Bay area, Shuen Wan, Tai Lam Chung Reservoir, Victoria Harbour, Urban Park.
Common Pochard 紅頭潛鴨	*Aythya ferina*					✓			✓	IUCN Red List Status: Vulnerable	Scarce winter visitor. Found in Deep Bay area, Lo Wu.
Tufted Duck 鳳頭潛鴨	*Aythya fuligula*	✓	✓	✓	✓	✓	✓	✓	✓	Fellowes *et al.* (2002): LC	Uncommon winter visitor. Found in Deep Bay area, Nam Chung, Starling Inlet

4.1.17 Besides the above-listed species of conservation importance, Eurasian Otter *Lutra lutra* is the most significant terrestrial mammal species known to occur in the Deep Bay area. This species occurs in a variety of lowland wetland habitats in the Deep Bay area, but given the human activities in the wetlands and disturbed nature of other habitats in the Study Area, it is very unlikely that this species would occur in the Application Site or the Study Area. The nearest record of the species was at the confluence area of Kam Tin River and Shan Pui River (B&V 2021).

4.1.18 Another species of conservation importance which was not recorded in the

_Hlk316631036

abovementioned literature, is a fish species of conservation importance, i.e. *Gobiopterus macrolepis*, recorded in the EIA study of Yuen Long Barrage (B&V 2021), which is endemic to China and is restricted to the Pearl River Delta (Cheng 1965). The species was observed in large schools of up to over a thousand individuals, staying near reedbed edges in Nam Sang Wai, and along channel margins at lower section of Yuen Long Nullah (approximately 50-100 individuals sighted), Shan Pui River, Kam Tin River and the lower Yuen Long Bypass Floodway. Therefore, it is rather widespread in suitable habitats e.g. channel within the present Study Area. It is listed as Vulnerable in the context of China (Jiang et al. 2016). Ecology and distribution of this species in Hong Kong and the wider Pearl River Delta region is however unknown.

4.2 Ecological Survey Results

Habitats

4.2.1 There were thirteen types of habitat identified within the Study Area, namely wasteland, developed area, plantation, *Leucaena* colony, nullah, channel, abandoned pond, pond, mitigation wetland, meander, flood storage pond, grassland/shrubland, and woodland.

4.2.2 The habitats within the Application Site and the Study Area are shown in **Table 4.3** and **Figure 4**. Photos of the habitats are presented in **Figure 5**. Plant species and their relative abundance within each habitat are listed in **Appendix A**.

Table 4.3 Habitats recorded within the Application Site and Study Area

Habitat	Application Site	Study Area excluding Application Site (ha)	Study Area (ha)
Wasteland	0.53	18.35	18.88
Developed Area	6.99	72.14	79.13
Plantation	0.58	24.36	24.94
Leucaena Colony	–	1.13	1.13
Nullah	–	1.14	1.14
Channel	0.05	20.84	20.89
Abandoned Pond	–	15.91	15.91
Pond	–	22.79	22.79
Mitigation Wetland	–	13.69	13.69
Meander	–	2.66	2.66
Flood Storage Pond	–	0.66	0.66
Grassland / Shrubland	–	1.98	1.98
Woodland	–	0.25	0.25
Total	**8.15**	**195.9**	**204.05**

*Habitat area sizes are rounding-off figures.

Habitats Inside the Study Area

4.2.3 ***Developed Area*** - Within the Study Area, this habitat type occupies the

_Hlk316631036

largest area (over one third in proportion) and is composed of villages, areas of open storage and light industry, along with extensive road infrastructure. These habitats were heavily modified and suffered from high levels of disturbance by anthropogenic factors and a low fauna and flora diversity, containing a large number of weedy and exotic plant species.

4.2.4 ***Plantation*** - Patches of roadside plantation were located surrounding and within the southeast of the Application Site, while a patch of plantation occupied the hillside located to the east of the Application Site within the Study Area. These plantations were generally of low ecological value due to the domination of exotic species. Species typically included *Eucalyptus* spp. and *Lophostemon confertus.*

4.2.5 ***Pond*** - Ponds were found to the north (across some wasteland habitat) and west (across Kam Tin River Drainage Channel) of the Application Site within the Study Area. These ponds were under maintenance for fish farming, aerators were observed in this habitat for the provision of oxygen to the cultivated fishes. Vegetation was found at the bund of the ponds.

4.2.6 ***Channel*** - Kam Tin River and Yuen Long Bypass Floodway (YLBF) were the two major channelized watercourses in the Study Area and were located to the west and the southwest of the Application Site respectively. Both YLBF and Kam Tin River Drainage Channel were widened, straightened and deepened to increase water flow capacity and alleviate flood risk. The bed and bank of YLBF were lined with grasscrete and a series of in-channel ponds were built along the dry weather flow channel. Water levels in YLBF were maintained by a fabridam at the confluence between YLBF and Kam Tin River. The regular vegetation management of the channels resulted in low botanical diversity.

4.2.7 ***Wasteland*** - Isolated patches of wasteland scattered within the Study Area with the largest patch to the north of the Application Site. Wasteland was dominated by ruderal vegetation. Plant species in this habitat type were typical of primary stages of vegetative succession, and those colonizing areas of bare or disturbed ground. Vegetation species typically found within this degraded habitat were mostly exotic weed species, including *Ageratum conyzoides, Desmodium tortuosum* and *Mikania micrantha*.

4.2.8 ***Abandoned pond*** - Several isolated abandoned ponds were identified to the north, southwest and west of the Application Site within the Study Area. These abandoned ponds were of various conditions depending on their duration of abandonment. Drying out of water was observed in the abandoned ponds having longer duration of abandonment, such as the one located to the immediate northwest of the Application Site. While for those abandoned ponds with shorter duration of abandonment, water was retained but degradation was observed at the pond bund. Both hydrophilic species (such as *Brachiaria mutica* and *Alternanthera philoxeroides*) and weedy species (such as *Alternanthera sessilis* and *Bidens alba*) were commonly found in these abandoned ponds. There were six aggregated abandoned ponds located near the southwest boundary of the Study Area. As found during the 12-month survey, these abandoned ponds were of very low water level with some parts of the pond bed exposed. During

_Hlk316631036

recent site visits in 2021, it was observed that weedy vegetation in these ponds was cleared and there was shallow water inside.

4.2.9 ***Mitigation Wetland*** - Several mitigation wetlands were found within the Study Area, including YLBF Mitigation Wetland to the southwest, and Sha Po Marsh to the southeast of the Application Site. These two were actively managed by AFCD and a private developer respectively. Sha Po Marsh is a brackish wetland established mainly to compensate for the habitat loss of the globally Near Threatened damselfly Four-spot Midget *Mortonagrion hirosei*. The Sha Po Marsh also supports other wetland dependent flora and fauna. In addition, two mitigation ponds were created at the entrance of the development for other impacted species.

4.2.10 ***Meander*** - Two meanders were identified within the Study Area. Apart from Kam Tin River meander locating to the west of Kam Tin River Drainage Channel, there was a meander located to the immediate southwest of the Application Site. This meander was subject to tidal influence of Kam Tin River and supported species which were tolerant of tidal fluctuation e.g. *Sonneratia* sp. and *Acanthus ilicifolius*.

4.2.11 ***Leucaena colony*** - *Leucaena* colony was found to the immediate north of the Application Site. *Leucaena leucocephala* and other weedy species including *Eragrostis tenella* and *Wedelia trilobata* colonized this area, *Musa* x *paradisiaca* was also cultivated there.

4.2.12 ***Grassland/Shrubland*** - Some areas of grassland/shrubland were found at the hillside to the east of the Application Site within the Study Area. This habitat was undergoing secondary succession and was dominated by shrub and grass species such as *Baeckea frutescens, Dicranopteris pedata, Lepidosperma chinense* and *Rhodomyrtus tomentosa*, which were highly typical of other grassland/shrubland in Hong Kong.

4.2.13 ***Flood storage pond*** - A flood storage pond was found to the north of the Application Site. This flood storage pond was built for stormwater management for controlling the quantity or quality of stormwater runoff, preventing the downstream catchment from flooding. Sparse vegetation was found at the pond bund.

4.2.14 ***Nullah*** – Several sections of nullah were identified within the Study Area. One was present to the immediate north of the Application Site while a few more were found at the further north of the Study Area. They were concrete-paved covering with sediment and straightened to divert water flow from Kam Tin River. Weedy species such as *Mikania micrantha* and an exotic mangrove species, *Sonneratia* sp. were found at the banks of the nullahs.

4.2.15 ***Woodland*** - A thin belt of woodland was located near the southwest boundary of the Study Area. Trees in this belt of woodland reached 7 to 12 meters, comprising of species including *Macaranga tanarius* var. *tomentosa* and *Melia azedarach*. Shrubs such as *Litsea rotundifolia* var. *oblongifolia* and *Psychotria asiatica* and climbers such as *Hypserpa nitida* and *Phyllanthus reticulatus* were also found in the understorey.

_Hlk316631036

Habitats Inside the Application Site

4.2.16 The Application Site comprised of mainly developed area (the existing soy sauce factory and open storage field) and minor areas of wasteland, plantation and channel.

4.2.17 ***Developed Area*** - Developed Area within the Application Site comprises an existing soy sauce factory, an open storage area and a small road. This habitat was largely paved with concrete. Vegetation found in this habitat was dominated by weedy species such as *Bidens alba*, *Leucaena leucocephala* and *Wedelia trilobata*.

4.2.18 ***Wasteland*** - Wasteland of minor area was identified within the Application Site at the northwest part. The disturbance nature of the habitat left a bare ground, favouring the colonization of weedy species. This habitat was largely dominated by weedy species such as *Panicum maximum, Brachiaria mutica* and *Bidens alba*. Mowing was also observed during survey.

4.2.19 ***Plantation*** - Patches of roadside plantation were located within and surrounding the southeast of the Application Site. This strip of plantation was of low ecological value due to the domination of exotic species and the narrow belt shape. Species typically included *Eucalyptus* spp. and *Lophostemon confertus*.

4.2.20 ***Channel*** – A small section of channel was located within and at the southern end of the Application Site. It is narrow and lacks open area with shallow water or exposed sediment. It is also dominated by exotic mangrove species *Sonneratia* sp.

Vegetation

4.2.21 A full list of flora species recorded within the Study Area during survey and their relative abundance within each habitat is provided in **Appendix A**.

4.2.22 A total of 317 plant species were recorded within the Study Area. No flora species of conservation importance was recorded within the Application Site while one flora species of conservation importance, *Aquilaria sinensis*, was recorded outside the Application Site but within the Study Area. The overall floral diversity was low.

4.2.23 *Camellia japonica, Casuarina equisetifolia, Cycas revoluta, Dimocarpus longan*, *Lagerstroemia indica*, *Lagerstroemia speciosa, Litchi chinensis, Michelia* x *alba*, *Mimosa diplotricha, Pittosporum tobira*, *Typha angustifolia* and *Rhododendron* sp. are exotic to Hong Kong and not considered of conservation importance, despite being considered rare by Corlett *et al.* (2000), listed as Vulnerable by IUCN (2019), considered as Vulnerable/Endangered in Threatened Species List of China's Higher Plants, considered as Vulnerable in China Plant Red Data Book, listed in Category I/II in State Protection and/or listed under Cap. 96 Forests and Countryside Ordinance.

_Hlk316631036

4.2.24 *Coccinia grandis* is native and widely cultivated, so they are not considered as species of conservation importance despite being considered very rare by Corlett *et al.* (2000).

4.2.25 Individuals of *Aquilaria sinensis* were found in the plantation outside the Application Site but within the Study Area (**Figure 6a**). *Aquilaria sinensis* is a native tree species common in the lowland forests and fung shui woods of Hong Kong but under the threat of illegal felling and over-exploitation in southern China including Hong Kong. It is scheduled under the Protection of Endangered Species of Animals and Plants Ordinance (Cap. 586) in Hong Kong, included in China Plant Red Data Book (vulnerable in China), Threatened Species List of China's Higher Plants (vulnerable in China) and Illustration of Rare & endangered plant in Guangdong Province, listed as "Vulnerable" in the IUCN Red List (IUCN 2018), listed in Appendix II of CITES, and listed in the book *Rare and Precious Plants of Hong Kong* (Near Threatened in China). In addition, wild individuals of *Aquilaria sinensis* are protected under State protection (Category II).

FAUNA

Mammals

4.2.26 Five mammal species were recorded within the Study Area, none of which was found within the Application Site (**Appendix B**). Species of conservation importance include Small Asian Mongoose and Japanese Pipistrelle. Locations and evaluation of these species are shown in **Figure 6a** and **Table 5.11**.

4.2.27 Small Asian Mongoose *Herpestes javanicus* was recorded in Abandoned Pond outside the Application Site. It is protected under Cap. 170 Wild Animals Protection Ordinance and is considered as Vulnerable in Red List of China's Vertebrates. It is uncommon and is found in countryside area of the New Territories.

4.2.28 Japanese Pipistrelle *Pipistrellus abramus* was recorded in *Leucaena* Colony, Wasteland, mitigation wetland, abandoned pond, channel, and developed area outside the Application Site. It is protected under Cap. 170 Wild Animals Protection Ordinance. It is very common and is widely distributed throughout Hong Kong.

Avifauna

4.2.29 A total of 103 bird species were recorded within the Study Area, including 41 species of conservation importance. 18 bird species were found within the Application Site but none was of conservation importance (**Table 4.4** and **Appendix C**). Most of the recorded species are common and widespread in Hong Kong. Evaluation of these species is also shown in **Table 5.11**.

4.2.30 Most winter migrants or passage migrants during spring and autumn were recorded along Kam Tin River Drainage Channel, which is located to the west of the Application Site.

_Hlk316631036

4.2.31 Ponds within the Study Area are potential foraging grounds for Grebes, Ardeidae, Cormorants and Kingfishers, and also contributed to the recorded waterbird over the 12-month survey period (**Table 4.4**).

4.2.32 The Application Site was of very low avifauna or waterbird use. The recorded bird diversity and abundance was much lower than other habitats outside.

4.2.33 Species of conservation importance were all recorded outside the Application Site and included Northern Shoveler, Eurasian Teal, Tufted Duck, Little Grebe, Black-faced Spoonbill, Yellow Bittern, Black-crowned Night Heron, Chinese Pond Heron, Eastern Cattle Egret, Grey Heron, Purple Heron, Great Egret, Intermediate Egret, Little Egret, Great Cormorant, Black-winged Kite, Chinese Sparrowhawk, Black Kite, Eastern Buzzard, Black-winged Stilt, Pied Avocet, Grey-headed Lapwing, Little Ringed Plover, Whimbrel, Spotted Redshank, Common Redshank, Marsh Sandpiper, Common Greenshank, Wood Sandpiper, Greater Coucal, Grey Nightjar, Pacific Swift, White-throated Kingfisher, Pied Kingfisher, Peregrine Falcon, Collared Crow, Chinese Penduline Tit, Zitting Cisticola, Rufous-capped Babbler, White-cheeked Starling and White-shouldered Starling.

4.2.34 A pair of Oriental Magpie was found nesting on an electric pylon outside the Application Site (**Figure 6a**). Other than this, no breeding behavior of birds was recorded within the Study Area (all egretries were outside the 500m Study Area).

4.2.35 Two ardeid night roosts were found within the 500m Study Area and surveyed during the survey period between 2019 and 2020 (**Figure 2b**). The maximum counts of the two ardeid night roosts were both less than 30 individuals of ardeids. Most of the roosting ardeids are Little Egret. However, it was observed that no egrets roosted at the one to the western side of Kam Tin River in 2021.

4.2.36 A winter roost of Great Cormorant was present in plantations more than 500m to the west of the Application Site. Around 4,560 individuals of Great Cormorant (maximum count) were found roosting there (**Figure 6b**). Very few Great Cormorants were recorded flying over the Application Site and adjacent areas.

Notes:

Survey programme covered 12 months

* Waterbirds bolded. Following classification in Waterfowl Counts by HKBWS

1. Conservation and protection status refers to Fellowes *et al.* (2002), Red List of China's Vertebrates (Jiang *et al.* 2016), IUCN (2020), China Red Data Book of Endangered Animals: Aves (Zheng and Wang, 1998), China State Major Protection Status, CITES (2020), Cap. 170 and Cap. 586.
   a. Conservation status by Fellowes *et al.* (2002): LC = Local Concern; PRC = Potential Regional Concern; RC = Regional Concern; PGC = Potential Global Concern; GC = Global Concern. Letters in parentheses indicate that the assessment is on the basis of restrictedness in breeding and/or roosting sites rather than in general occurrence.
   b. Conservation status by Red List of China's Vertebrates (RLCV) (Jiang *et al.* 2016): NT = Near Threatened; EN = Endangered.
   c. Conservation status by China Red Data Book of Endangered Animals: Aves (Zhang and Wang, 1998): EN = Endangered; VU = Vulnerable.
   d. Conservation status by IUCN (2021): NT = Near Threatened; EN = Endangered; VU = Vulnerable

_Hlk316631036

e. Protection status by China State Major Protection Status (CSMPS): II = Class II Protected Species in China.

f. Protection status by CITES (2020): II = Listed in CITES Appendix II.

g. All wild birds in Hong Kong are protected under Cap. 170 Wild Animals Protection Ordinance.

h. Cap. 586 = Protection of Endangered Species of Animals and Plants Ordinance.

Flight Path Survey

4.2.37 Though TSL Egretry was abandoned in 2021 ardeid breeding season, it was still active in 2019 and 2020, and a total of 306 and 288 flight observations was made in 2019 and 2020, respectively. The observed flight directions of ardeid took off from TSL Egretry were similar in both 2019 and 2020, with the majority flying a general northward direction (flying across Yuen Long Highway and the Yuen Long Bypass Floodway) with much smaller numbers flying eastward to Kam Tin River and westward to Yuen Long Town directions. There were occasional individuals landing at the ponds in front of the Egretry (**Figures 6c and 6d**). These observations were consistent with those reported from the literature reviewed.

4.2.38 For the breeding ardeid towards northern direction, after passing Yuen Long Highway, their flying directions showed some variations. **Figure 6e** and **6f** present the numbers and percentages of the flying directions of the breeding ardeids (**Zone A** to **I**). These zones covered all recorded flight recorded flight directions. Those breeding ardeids showed a strong tendency of flying towards the direction of Kam Tin River. As shown on **Figures 6e** and **6f**, after passing Yuen Long Highway, the largest proportion of flight directions was in the most eastern direction (i.e., Zone I) in both 2019 and 2020 (120 and 168 individuals respectively; or 39.22% and 58.33% respectively). Most of the ardeids flew along Kam Tin River after leaving Zone I and there was no record of breeding ardeids flying across the Application Site.

4.2.39 While no breeding of ardeids was found in TSL Egretry in 2021, a new egretry was recorded in Kam Po Road in 2021, which is over 2.5 km southeast of the Application Site. Flight-line surveys were hence conducted between May and August 2021 for the new egretry. The results showed that the breeding ardeids in Kam Po Road egretry mainly flew towards northwest direction along Kam Tin River for foraging, and some minor flight observations were recorded flying eastern, western and southern directions (**Figure 6g**). Decreasing number of ardeids from the new egretry along Kam Tin River was observed, likely because some ardeids landed in the wetlands in the vicinity of Kam Tin River. There was no record of breeding ardeids which took off from the new egretry and flew through the Application Site.

4.2.40 Regarding the winter flight path survey, a total of 148 flight observations were recorded between December 2019 and February 2020, which are summarized as 5 flight-lines (major, minor and occasional) (**Figure 6h**). Most of the flight-lines were observed along Kam Tin River (about 59 %)

_Hlk316631036

and along Kam Tin River first then turned to northwest directions (about 38% from three minor flightlines), while only an occasional flight-line (about 3%) was observed further north of the patch of wasteland habitat immediately north of the Application Site (**Figure 6h**). Given the Application Site is being outside the major Deep Bay wetland area, and the paucity of wetland habitat to the east and northeast directions, there was no major bird flight path over the Application Site as expected.

Herpetofauna

4.2.41 Eight reptile species were recorded within the Study Area, including four species of conservation importance (**Appendix D**). Most of the recorded species are common and widespread in Hong Kong. Species of conservation importance included Burmese Python, Indo-Chinese Rat Snake, Common Rat Snake and Four-clawed Gecko. Locations and evaluation of these species are shown in **Figure 6a** and **Table 5.11**. No reptile was recorded within the Application Site.

4.2.42 Eight amphibian species were recorded within the Study Area in total (**Appendix E**). All the recorded species are common and widespread in Hong Kong. No amphibian species was recorded within the Application Site.

Odonata

4.2.43 33 odonata species were recorded within the Study Area in total, including 4 species of conservation importance (**Appendix F**). Most of the recorded species are common and widespread in Hong Kong. Species of conservation importance included Four-spot Midget, Mangrove Skimmer, Ruby Darter and Scarlet Basker. Locations and evaluation of these species are shown in **Figure 6a** and **Table 5.11**. Four dragonfly species were recorded within the Application Site, none of which was of conservation importance.

Butterflies

4.2.44 51 butterfly species were recorded within the Study Area in total, including 5 species of conservation importance (**Appendix G**). Most of the recorded species are common and widespread in Hong Kong. Species of conservation importance included Forget-me-not, Cornelian, Metallic Cerulean, Danaid Eggfly and Swallowtail. Locations and evaluation of these species are shown in **Figure 6a** and **Table 5.11**. Seven butterfly species were recorded within the Application Site, none of which was of conservation importance.

Firefly

4.2.45 No Bent-winged firefly was found within the Study Area during the survey. Reported Bent-winged Firefly locations from literature were near the western end of Kam Tin River meander south of Nam Sang Wai which is far away from the Application Site (**Figure 3**). Only several sporadic sightings of the common *Pyrocoelia analis* were made in meander, channel, plantation and wasteland habitats, including those within the Application Site (**Figure 6i**). *Pyrocoelia analis* is a habitat generalist that

_Hlk316631036

occurs in a wide range of open lowland areas such as village environs, fishponds and coasts, and occasionally found in urban areas (such as a roadside walkway and a landscaped area in Yuen Long town centre) as attracted by anthropogenic lightings (Cheng *et al*. 2020).

Aquatic Fauna

4.2.46 A total of 16 species were recorded within the Study Area (Aquatic Sampling Location No. 1 – 7, see **Figure 2a**). Among the recorded species, 10 of them were fishes and 6 of them were invertebrates. Most of the recorded species are considered common and widespread in similar habitats in Hong Kong, where *Oreochromis niloticus* was observed to be the dominant species among the Study Area. Two of the recorded fish species, *Gobiopterus macrolepis* and *Channa asiatica*, are considered as conservation importance and were found outside the Application Site. Evaluation of these species are shown in **Table 5.11**.

5. EVALUATION OF HABITATS AND SPECIES

5.1.1 The ecological importance of each habitat type within the Study Area was evaluated in accordance with the criteria stipulated in Annex 8 of TM-EIAO (**Tables 5.1 to 5.9**). The ecological importance of the Application Site was also presented in **Table 5.10**.

5.1.2 In accordance with Table 3, Annex 8 of the TM-EIAO, the ecological value of species recorded within the Study Area were assessed in terms of protection status (e.g. fauna protected under WAPO (except birds), and flora and fauna protected under regional/global legislation/conventions), species distribution (e.g. endemic), and rarity (e.g. rare or restricted).

5.1.3 Flora and fauna species protected by the following laws/regulations, listed under the following conventions and/or endemic to Hong Kong were considered to be of conservation importance are evaluated in **Table 5.11**. However, this excludes exotic weeds, escaped cultivars or captive species, vagrants and introduced species which have lower ecological value. Species which are classified by IUCN as Near Threatened (NT), Least Concern (LC), Data Deficient (DD), or Not Evaluated (NE), and not covered by any other laws/regulations/conventions are not considered of conservation importance in the present EcoIA.

- The International Union for Conservation of Nature and Natural Resources (IUCN) Red List of Threatened Species;
- China Plant Red Data Book;
- China Species Red List;
- China Red Data Book of Endangered Animals;
- Category I or II protected species in mainland China;
- Threatened Species List of China's Higher Plants (Qin *et al*. 2017);

_Hlk316631036

- The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES);
- Forestry Regulations (Cap. 96A) which are subsidiary legislation of the Forests and Countryside Ordinance (Cap. 96);
- Wild Animals Protection Ordinance (Cap. 170) (except birds as all wild birds are protected under the ordinance but their conservation importance is not equal);
- Protection of Endangered Species of Animals and Plants Ordinance (Cap. 586);
- PRC Wild Animal Protection Law;
- Plant species considered 'Rare' or 'Very Rare' listed by Corlett *et al*. (2000) or Yip *et al*. (2010) where applicable; and
- Fauna species considered of concern in Fellowes *et al*. (2002).

Table 5.1 Evaluation of Developed Area within the Study Area

Criterion	Description
Naturalness	Entirely man-made
Size	79.13ha
Diversity	Low floral diversity (114) Number of Species of fauna: Mammal (2), Avifauna (34), Reptile (1), Amphibian (4), Odonata (10), Butterfly (20)
Rarity	No flora species of conservation importance, 5 bird species of conservation importance (Collared Crow, White-throated Kingfisher, Black Kite, Little Egret, Great Egret), 1 mammal species (Japanese Pipistrelle), 1 butterfly species (Danaid Eggfly)
Re-creatability	Readily re-created
Fragmentation	N/A
Ecological linkage	No significant linkages with other habitats of ecological importance
Potential value	Low
Nursery/breeding ground	Not known as significant nursery or breeding grounds, but nesting of Oriental Magpie was observed
Age	N/A
Abundance/richness of wildlife	Low faunal abundance
Overall ecological value	Very low

Table 5.2 Evaluation of Plantation within the Study Area

Criterion	Description
Naturalness	Man-made. Dominated by exotic species.
Size	24.94ha
Diversity	Low floral diversity (94)

_Hlk316631036

Criterion	Description
	Number of faunal Species: Mammal (0), Avifauna (33), Reptile (2) , Amphibian (2) , Odonata (4) , Butterfly (19)
Rarity	Flora species of conservation importance included *Aquilaria sinensis*, 4 bird species of conservation importance (Black Kite, Greater Coucal, Rufous- capped Babbler, White-cheeked Starling), 1 butterfly species (Swallowtail)
Re-creatability	Readily re-created
Fragmentation	Highly fragmented by developed area and roads
Ecological linkage	No significant linkages with habitats of ecological significance
Potential value	Limited potential due to disturbance and high proportion of exotic species
Nursery/breeding ground	Not a nursery or breeding ground of significance
Age	Unknown
Abundance/richness of wildlife	Low faunal abundance
Overall ecological value	Low

Table 5.3 Evaluation of Wasteland within the Study Area

Criterion	Description
Naturalness	Colonising habitat on areas of bare ground or former agricultural land. Land has previously been affected by anthropogenic changes and is now subject to very early-stage vegetative succession
Size	18.88ha
Diversity	Moderate floral diversity (141) Number of faunal Species: Mammal (4), Avifauna (56), Reptile (4), Amphibian (3), Odonata (15), Butterfly (19)
Rarity	No flora species of conservation importance, 1 mammal species (Japanese Pipistrelle), 16 bird species of conservation importance, 1 reptile species (Burmese Python) and 1 odonata species (Scarlet Basker)
Re-creatability	Readily re-created
Fragmentation	Limited fragmentation
Ecological linkage	No significant functional or ecological linkage with other habitats. Ponds occur to the north.
Potential value	Low
Nursery/breeding ground	Not known as significant nursery or breeding ground
Age	Unknown
Abundance/richness of wildlife	Low floral and faunal abundance
Overall ecological value	Low

Table 5.4 Evaluation of Abandoned Ponds, Ponds and Mitigation Wetlands within the Study Area

Criterion	Description		
	Abandoned Ponds	Ponds	Mitigation Wetland

_Hlk316631036

Criterion	Description		
	Abandoned Ponds	**Ponds**	**Mitigation Wetland**
Naturalness	Man-made origin, some might be semi-natural, dependent on the duration of abandonment	Man-made	Semi-natural. Most are man-made origin
Size	15.91ha	22.79ha	13.69ha
Diversity	Low floral diversity (54) Number of faunal Species: Mammal (2), Avifauna (63), Reptile (1), Amphibian (6), Odonata (23), Butterfly (18)	Low floral diversity (32) Number of faunal Species: Mammal (0), Avifauna (44), Reptile (0), Amphibian (1), Odonata (12), Butterfly (4)	Low floral diversity (103) Number of faunal Species: Mammal (1), Avifauna (59), Reptile (7), Amphibian (7), Odonata (23), Butterfly (35)
Rarity	No flora species of conservation importance, 2 mammal (Small Asian Mongoose, Japanese Pipistrelle), 2 odonata species (Ruby Darter, Scarlet Basker) and 20 bird species of conservation importance	No flora species of conservation importance, 18 bird species of conservation importance	No flora species of conservation importance, 1 mammal species (Japanese Pipistrelle), 3 reptile species (Indo-Chinese Rat Snake, Common Rat Snake, Four-clawed Gecko), 3 odonata species (Four-spot Midget, Mangrove Skimmer, Scarlet Basker), 4 butterfly species (Forget-me-not, Cornelian, Metallic Cerulean, Swallowtail), 2 fish species (*Gobiopterus macrolepis*, *Channa asiatica*) and 19 bird species of conservation importance
Re-creatability	Readily re-created	Readily re-created	Readily re-created
Fragmentation	Some fragmentation, both within Study Area and from other areas of pond	Some fragmentation, both within Study Area and from other areas of pond	Fragmented from other mitigation Wetlands
Ecological linkage	Linkages with other high-value habitats in Deep Bay area for those remaining active and closer to WCA, but not significant for those dry/overgrown, or outside WBA and isolated by developed area such as highways.		
Potential value	Value would be improved if fish farming is resumed or protected and managed for wildlife, especially if habitat linkage with other ponds in area established. Those adjacent to mitigation wetlands or large patch of active ponds	Value would be improved if protected and managed for wildlife, especially if habitat linkage with other ponds in area established. Ponds at the northernmost and northwest of Study Area have higher potential value given location and size.	Some scope for enhancement with habitat management for wildlife.

_Hlk316631036

Criterion	Description		
	Abandoned Ponds	**Ponds**	**Mitigation Wetland**
	have higher potential value.	Ponds isolated by wasteland and urban area have lower potential value.	
Nursery/breeding ground	No significant nursery or breeding ground known	No significant nursery or breeding ground known	No significant nursery or breeding ground known
Age	Unknown	Unknown	At least a decade
Abundance/richness of wildlife	Low to moderate	Moderate	The YLBF Mitigation Wetland is known to support moderate abundance of wetland fauna
Overall ecological value	Low to medium value for larger and continuous patches, given the conditions of these abandoned ponds, which have either dry up or overgrown by vegetation, and their lower ecological values for waterbirds when compared with traditional fishponds with drain down practices and their potential value if properly managed. Low for small and isolated abandoned ponds including those to the north of the Application Site	Medium value	Medium value

Table 5.5 Evaluation of Channel, Meander and nullah within the Study Area

Criterion	Description		
	Channel	**Meander**	**Nullah**
Naturalness	Entirely man-made habitat, but for the outer section of YLBF under influence of natural tidal flow	Streams subject to human modifications	Streams subject to human modifications
Size	20.89ha	2.66ha	1.14ha
Diversity	Low floral diversity (26) Number of faunal Species: Mammal (2), Avifauna (53), Reptile (0), Amphibian (1), Odonata (11), Butterfly (4)	Low floral diversity (6) Number of faunal Species: Mammal (0), Avifauna (18), Reptile (0), Amphibian (0), Odonata (8), Butterfly (7)	Low floral diversity (14) Number of faunal Species: Mammal (0), Avifauna (16), Reptile (1), Amphibian (0), Odonata (0),

_Hlk316631036

Criterion	Description		
	Channel	**Meander**	**Nullah**
			Butterfly (0)
Rarity	No flora species of conservation importance, 1 mammal (Japanese Pipistrelle), 1 odonata species and (Scarlet Basker), 23 bird species of conservation importance	No flora species of conservation importance, 2 odonata species (Scarlet Basker and Ruby Darter) and 6 bird species of conservation importance	No flora species of conservation importance, 1 reptile species (Common Rat Snake) and 5 bird species of conservation importance
Re-creatability	Easily recreated	Readily re-created	Readily re-created
Fragmentation	Not fragmented for YLBF	Limited fragmentation	Limited fragmentation
Ecological linkage	Water body linked to Deep Bay area	Directly connected with Kam Tin River	Directly connected with Kam Tin River
Potential value	Limited potential for further increase in value due to constraints imposed by artificial concrete structure and management regime	Very little potential for increase in value without re-engineering	Very little potential for increase in value without re-engineering
Nursery/breeding ground	YLBF not a significant nursery or breeding ground but these major channels are presumed to be a foraging area for breeding ardeids and common smaller waterbirds	Not known	Not known
Age	10 years	Not known	Not known
Abundance/richness of wildlife	For waterbirds, moderate to high during summer, high during winter	Low	Very low
Overall ecological value	Medium for large-sized main drainage channels such as YLBF and KTMDC of which the sediments on bed would be exposed during low tide Low for other channels which are smaller and narrower including the section within the Application Site. Different from the KTMDC or YLBF, this section was much narrow and without an open area with shallow water or exposed sediment, due to the width and exotic mangroves *Sonneratia* sp. along the bank,	Low to Medium for Kam Tin River Meander Low for other meander	Very low

_Hlk316631036

Table 5.6 Evaluation of Grassland/Shrubland within the Study Area

Criterion	Description
Naturalness	Natural habitat undergone natural succession and developed from hilly terrain
Size	1.98ha
Diversity	Low floral diversity (6); Number of faunal Species: Mammal (0), Avifauna (10), Reptile (0), Amphibian (0), Odonata (0), Butterfly (9)
Rarity	No flora or fauna species of conservation importance
Re-creatability	Readily re-created
Fragmentation	Fragmented from other areas of grassland/shrubland
Ecological linkage	Limited linkages with habitats of ecological significance
Potential value	Limited due to high levels of human influence
Nursery/breeding ground	No known as significant nursery or breeding ground
Age	N/A
Abundance/richness of wildlife	Low
Overall ecological value	Low

Table 5.7 Evaluation of *Leucaena* Colony within the Study Area

Criterion	Description
Naturalness	Colonization of *Leucaena leucocephala* on areas of bare ground that has previously been adapted by anthropogenic changes
Size	1.13ha
Diversity	Very low floral diversity (22) Very low faunal species was reported due to small size and linear shape. Number of faunal Species: Mammal (1), Avifauna (8), Reptile (0), Amphibian (0), Odonata (1), Butterfly (0)
Rarity	No floral species of conservation importance; 2 bird species (Chinese Sparrowhawk, White-cheeked Starling) and 1 mammal (Japanese Pipistrelle) species of conservation importance
Re-creatability	Readily re-created
Fragmentation	Formed thin belt to the north of the Application Site
Ecological linkage	No significant linkages with other habitats of ecological importance
Potential value	Low
Nursery/breeding ground	No significant nursery or breeding ground known
Age	N/A
Abundance/richness of wildlife	Very low
Overall ecological value	Very low

Table 5.8 Evaluation of Flood Storage Pond within the Study Area

Criterion	Description
Naturalness	Man-made

_Hlk316631036

Criterion	Description
Size	0.66ha
Diversity	Low floral diversity (6) Number of faunal Species: Mammal (0), Avifauna (5), Reptile (0), Amphibian (0), Odonata (0), Butterfly (0)
Rarity	No flora or fauna species of conservation importance
Re-creatability	Readily re-created
Fragmentation	Stand-alone pond
Ecological linkage	No significant linkages with habitats of ecological significance
Potential value	Low
Nursery/breeding ground	Not a nursery or breeding ground of significance
Age	About 10 years
Abundance/richness of wildlife	Low
Overall ecological value	Low

Table 5.9 Evaluation of Woodland within the Study Area

Criterion	Description
Naturalness	Largely natural, some exotic species was found
Size	0.25ha
Diversity	Low floral diversity (17) due to small portion within the Study Area No faunal species was reported due to small size and linear shape
Rarity	No flora nor fauna species of conservation importance
Re-creatability	Readily re-created but trees need time to be mature
Fragmentation	Only a narrow belt within the Study Area
Ecological linkage	No significant linkages with habitats of ecological significance
Potential value	Limited potential for direct increase in habitat value unless more diverse vegetative community can develop
Nursery/breeding ground	No significant nursery/ breeding record
Age	About 10 years
Abundance/richness of wildlife	Low
Overall ecological value	Low

Table 5.10 Evaluation of Habitats within the Application Site

Criterion	Description
Naturalness	Predominated by developed area which is entirely man-made. Other minor habitats are also man-made (plantation) or subject to modification (channel), or being managed (wasteland)
Size	Total 8.15 ha, predominated by developed area (6.99 ha), with minor areas of other habitats (plantation 0.58 ha, wasteland 0.53 ha, channel 0.05 ha)
Diversity	Low floral (58) and faunal diversity Mammal (0), Avifauna (18), Reptile (0), Amphibian (0), Odonata (4), Butterfly (7)
Rarity	No floral or faunal species of conservation importance.
Re-creatability	All are readily re-created
Fragmentation	Plantation highly fragmented by developed area and roads as in narrow belt shape; developed area, channel and wasteland of limited fragmentation
Ecological linkage	No significant linkages with habitats of ecological significance, except channel finally discharge to Kam Tin River Drainage Channel.
Potential value	Either low (Developed Area, Wasteland) or limited potential for direct increase in habitat value due to disturbance and high proportion of exotic species (plantation) or unless with modification (channel)
Nursery/breeding ground	No significant nursery/ breeding record
Age	N/A
Abundance/richness of wildlife	Low
Overall ecological value	**Low** as dominated by developed area. Other minor habitats (plantation, wasteland and channel) are also of low ecological value. This section of channel was of lower ecological value than other channel habitats in the study area due to the narrow width and the overgrown of exotic mangroves *Sonneratia* sp. along the bank. Furthermore, there is no open area with shallow water or exposed sediment.

Table 5.11 Evaluation of Species of Conservation Importance Recorded in the Study Area

No.	Species Name [1]	Conservation Status [2,3,4,5,6,7,8,9,10 , A,B,C,D,E,F,G]	Rarity and Distribution [1]	Locations
	PLANT			
1	Incense Tree *Aquilaria sinensis*	Cap. 586 [3] CITES: Appendix II[4] IUCN Red List: Vulnerable [6] Threatened Species List of China's Higher Plants: Vulnerable [C] China Plant Red Data Book: Vulnerable [D] Included in Illustrations of Rare & Endangered Plant in Guangdong Province [E] Listed in Rare and Precious Plants of Hong Kong [F] State Protection: Category II[G]	Lowland forests and fung shui woods	Outside Application Site (Plantation)
	MAMMAL			
2	Small Asian Mongoose *Herpestes javanicus*	Cap. 170; Red List of China's Vertebrate: Vulnerable	Uncommon. Found in N.T. countryside area	Outside Application Site (Abandoned Pond)
3	Japanese Pipistrelle *Pipistrellus abramus*	Cap. 170	Very Common. Widely distributed throughout Hong Kong.	Outside Application Site (Abandoned Pond, Channel, *Leucaena* Colony, Mitigation Wetland and Developed Area, Wasteland)
	Bird **(Remark: all wild bird species are protected under Cap. 170 Wild Animals Protection Ordinance in Hong Kong [2])**			
4	Northern Shoveler *Spatula clypeata*	Fellowes *et al.* (2002): RC	Abundant winter visitor. Found in Deep Bay area.	Outside Application Site (Channel, Meander)
5	Eurasian Teal *Anas crecca*	Fellowes *et al.* (2002): RC	Common winter visitor. Found in Deep Bay area, Shuen Wan, Tai Lam Chung Reservoir, Victoria Harbour, Urban Park.	Outside Application Site (Abandoned Pond, Channel)
6	Tufted Duck *Aythya fuligula*	Fellowes *et al.* (2002): LC	Uncommon winter visitor. Found in Deep Bay area, Nam Chung, Starling Inlet.	Outside Application Site (Channel)
7	Little Grebe *Tachybaptus ruficollis*	Fellowes *et al.* (2002): LC	Common resident. Found in Deep Bay area.	Outside Application Site (Abandoned Pond, Pond, Channel and Meander)
8	Black-faced Spoonbill *Platalea*	IUCN Red List: Endangered; Class 2 Protected Animal of	Common winter visitor. Found in Deep Bay	Outside Application Site (Channel)

No.	Species Name [1]	Conservation Status [2,3,4,5,6,7,8,9,10 , A,B,C,D,E,F,G]	Rarity and Distribution [1]	Locations
	minor	China; China Red Data Book: Endangered; Fellowes *et al.* (2002): PGC; Red List of China's Vertebrates: Endangered	area.	
9	Yellow Bittern *Ixobrychus sinensis*	Fellowes *et al.* (2002): (LC)	Uncommon summer visitor and passage migrant. Found in Deep Bay area, Chek Keng, Tai Long Wan.	Outside Application Site (Pond)
10	Black-crowned Night Heron *Nycticorax nycticorax*	Fellowes *et al.* (2002): (LC)	Common resident and winter visitor. Widely distributed in Hong Kong.	Outside Application Site (Abandoned Pond, Mitigation Wetland, Nullah, Wasteland)
11	Chinese Pond Heron *Ardeola bacchus*	Fellowes *et al.* (2002): PRC,(RC)	Common resident. Widely distributed in Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Channel, Meander, Mitigation Wetland, Nullah, Wasteland)
12	Eastern Cattle Egret *Bubulcus coromandus*	Fellowes *et al.* (2002): (LC)	Resident and common passage migrant. Widely distributed in Hong Kong.	Outside Application Site (Wasteland, Abandoned Pond, Pond, Mitigation Wetland)
13	Grey Heron *Ardea cinerea*	Fellowes *et al.* (2002): PRC	Common winter visitor. Found in Deep Bay area, Starling Inlet, Kowloon Park, Cape D'Aguilar.	Outside Application Site (Abandoned Pond, Pond, Channel, Mitigation Wetland, Nullah, Wasteland)
14	Purple Heron *Ardea purpurea*	Fellowes *et al.* (2002): RC	Uncommon passage migrant. Found in Deep Bay area.	Outside Application Site (Mitigation Wetland)
15	Great Egret *Ardea alba*	Fellowes *et al.* (2002): PRC,(RC)	Common resident and winter visitor. Widely distributed in Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Channel, Meander, Mitigation Wetland, Nullah, Developed Area, Wasteland)
16	Intermediate Egret *Egretta intermedia*	Fellowes *et al.* (2002): RC	Common passage migrant. Found in Deep Bay area, Tai Long Wan, Starling Inlet, Tai O, Cape D'Aguilar.	Outside Application Site (Abandoned Pond, Pond, Wasteland)
17	Little Egret *Egretta garzetta*	Fellowes *et al.* (2002): PRC,(RC)	Common resident. Widely distributed in coastal area throughout Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Channel, Meander, Mitigation Wetland, Nullah, Developed Area, Wasteland)
18	Great Cormorant *Phalacrocorax carbo*	Fellowes *et al.* (2002): PRC	Common winter visitor. Widely distributed in coastal areas throughout Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Channel, Mitigation Wetland, Wasteland)

No.	Species Name [1]	Conservation Status [2,3,4,5,6,7,8,9,10 , A,B,C,D,E,F,G]	Rarity and Distribution [1]	Locations
19	Black-winged Kite *Elanus caeruleus*	Cap 586; CITES: Appendix II; China Red Data Book: Vulnerable; Fellowes *et al.* (2002): LC	Occasional visitor. Found in Ha Tsuen, Deep Bay area.	Outside Application Site (Pond)
20	Chinese Sparrowhawk *Accipiter soloensis*	Cap 586; CITES: Appendix II; Class 2 Protected Animal of China	Uncommon passage migrant. Found in Tsim Bei Tsui, Kadoorie Farm & Botanic Garden, Tai Po Kau.	Outside Application Site (*Leucaena* Colony)
21	Black Kite *Milvus migrans*	Cap 586; CITES: Appendix II; Class 2 Protected Animal of China; Fellowes *et al.* (2002): (RC)	Common resident and winter visitor. Widely distributed in Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Channel, Mitigation Wetland, Plantation, Developed Area, Wasteland)
22	Eastern Buzzard *Buteo japonicus*	Cap 586; CITES: Appendix II; Class 2 Protected Animal of China	Common winter visitor. Widely distributed in Hong Kong.	Outside Application Site (Mitigation Wetland, Wasteland)
23	Black-winged Stilt *Himantopus himantopus*	Fellowes *et al.* (2002): RC	Common passage migrant. Found in Deep Bay area, Long Valley, Kam Tin.	Outside Application Site (Abandoned Pond, Pond, Channel)
24	Pied Avocet *Recurvirostra avosetta*	Fellowes *et al.* (2002): RC	Abundant winter visitor. Found in Deep Bay area.	Outside Application Site (Channel)
25	Grey-headed Lapwing *Vanellus cinereus*	Fellowes *et al.* (2002): LC	Scarce winter visitor. Found in Kam Tin, Tsim Bei Tsui, Lo Wu, Tai Long Wan, Shuen Wan, Castle Peak coast, Chek Lap Kok	Outside Application Site (Channel)
26	Little Ringed Plover *Charadrius dubius*	Fellowes *et al.* (2002): (LC)	Common winter visitor and passage migrant. Widely distributed in freshwater areas throughout Hong Kong.	Outside Application Site (Channel)
27	Whimbrel *Numenius phaeopus*	Fellowes *et al.* (2002): LC	Common passage migrant. Found in Deep Bay area, Sai Kung, Tung Ping Chau, Ninepins, Cape D'Aguilar, Pok Fu Lam.	Outside Application Site (Channel)
28	Spotted Redshank *Tringa erythropus*	Fellowes *et al.* (2002): RC	Abundant in winter and spring. Found in Deep Bay area.	Outside Application Site (Channel)
29	Common Redshank *Tringa totanus*	Fellowes *et al.* (2002): RC	Common passage migrant. Found in Deep Bay area.	Outside Application Site (Pond, Channel)
30	Marsh Sandpiper *Tringa stagnatilis*	Fellowes *et al.* (2002): RC	Common winter visitor and passage migrant. Found in Deep Bay area, Shuen Wan, Long Valley, Kam Tin, Sai Kung.	Outside Application Site (Pond, Channel)

No.	Species Name [1]	Conservation Status [2,3,4,5,6,7,8,9,10 , A,B,C,D,E,F,G]	Rarity and Distribution [1]	Locations
31	Common Greenshank *Tringa nebularia*	Fellowes *et al.* (2002): RC	Abundant passage migrant and winter visitor. Found in Deep Bay area.	Outside Application Site (Abandoned Pond, Pond, Channel)
32	Wood Sandpiper *Tringa glareola*	Fellowes *et al.* (2002): LC	Common passage migrant and winter visitor. Widely distributed in wetland area throughout Hong Kong.	Outside Application Site (Abandoned Pond)
33	Greater Coucal *Centropus sinensis*	Class 2 Protected Animal of China; China Red Data Book: Vulnerable	Common resident. Widely distributed in Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Meander, Mitigation Wetland, Plantation, Wasteland)
34	Grey Nightjar *Caprimulgus jotaka*	Fellowes *et al.* (2002): LC	Scarce passage migrant and summer visitor. Widely distributed in Hong Kong.	Outside Application Site (Mitigation Wetland)
35	Pacific Swift *Apus pacificus*	Fellowes *et al.* (2002): (LC)	Common spring migrant and summer visitor. Widely distributed in Hong Kong.	Outside Application Site (Mitigation Wetland)
36	White-throated Kingfisher *Halcyon smyrnensis*	Fellowes *et al.* (2002): (LC)	Common resident. Widely distributed in coastal areas throughout Hong Kong.	Outside Application Site (Abandoned Pond, Channel, Mitigation Wetland, Developed Area, Wasteland)
37	Pied Kingfisher *Ceryle rudis*	Fellowes *et al.* (2002): (LC)	Uncommon resident. Widely distributed in lakes and ponds throughout Hong Kong.	Outside Application Site (Abandoned Pond, Pond, Channel, Mitigation Wetland)
38	Peregrine Falcon *Falco peregrinus*	Cap 586; CITES: Appendix II; Class 2 Protected Animal of China; Fellowes *et al.* (2002): (LC);	Scarce resident and winter visitor. Widely distributed in Hong Kong.	Outside Application Site (Mitigation Wetland, Wasteland)
39	Collared Crow *Corvus torquatus*	IUCN Red List: Vulnerable; Red List of China's Vertebrate: NT; Fellowes *et al.* (2002): LC	Uncommon resident. Found in Inner Deep Bay area, Nam Chung, Kei Ling Ha, Tai Mei Tuk, Pok Fu Lam, Chek lap Kok, Shuen Wan, Lam Tsuen.	Outside Application Site (Abandoned Pond, Pond, Channel, Mitigation Wetland, Developed Area)
40	Chinese Penduline Tit *Remiz consobrinus*	Fellowes *et al.* (2002): RC	Common passage migrant and winter visitor. Found in Deep Bay area, Tai O, Mui Wo, Long Valley, Luk Keng, Chek Lap Kok.	Outside Application Site (Mitigation Wetland)
41	Zitting Cisticola *Cisticola juncidis*	Fellowes *et al.* (2002): LC	Common passage migrant and winter visitor. Widely distributed in grassland throughout Hong Kong.	Outside Application Site (Abandoned Pond, Mitigation Wetland, Wasteland)
42	Rufous-capped Babbler	Fellowes *et al.* (2002): LC	Common resident. Found mainly in	Outside Application Site (Plantation)

No.	Species Name [1]	Conservation Status [2,3,4,5,6,7,8,9,10 , A,B,C,D,E,F,G]	Rarity and Distribution [1]	Locations
	Stachyridopsis ruficeps		shrublands and woodlands of New Territories.	
43	White-cheeked Starling *Spodiopsar cineraceus*	Fellowes *et al.* (2002): PRC	Common winter visitor. Found in Deep Bay area, Kam Tin, Long Valley.	Outside Application Site (*Leucaena* Colony, Plantation, Wasteland)
44	White-shouldered Starling *Sturnia sinensis*	Fellowes *et al.* (2002): (LC)	Common passage migrant. Found in Kam Tin, Deep Bay area, Po Toi Island, Long Valley, Victoria Park, Ho Chung, Ma Tso Lung, Mui Wo, Lam Tsuen Valley.	Outside Application Site (Abandoned Pond, Wasteland)
	REPTILE			
45	Burmese Python *Python bivittatus*	Cap. 170; Cap 586; CITES: Appendix II; Class 1 Protected Animal of China; China Red Data Book: Critically Endangered; IUCN Red List: Vulnerable; Fellowes *et al.* (2002): PRC	Widely distributed throughout Hong Kong.	Outside Application Site (Wasteland)
46	Indo-Chinese Rat Snake *Ptyas korros*	China Red Data Book: Endangered; Fellowes *et al.* (2002): PRC; Red List of China's Vertebrates: Vulnerable	Widely distributed throughout Hong Kong.	Outside Application Site (Mitigation Wetland)
47	Common Rat Snake *Ptyas mucosus*	Cap 586; Appendix 2 of CITES; Fellowes *et al.* (2002): PRC; China Red Data Book: Endangered; Red List of China's Vertebrates: Endangered	Widely distributed throughout Hong Kong.	Outside Application Site (Mitigation Wetland, Nullah)
48	Four-clawed Gecko *Gehyra mutilata*	Red List of China's Vertebrates: Vulnerable	Widely but thinly distributed throughout Hong Kong.	Outside Application Site (Mitigation Wetland)
	ODONATE			
49	Four-spot Midget *Mortonagrion hirosei*	IUCN Red List: Near Threatened; Fellowes *et al.* (2002): GC;	Common. Double Island, Luk Keng, Mai Po Marshes, Nam Chung, Sam A Tsuen and Sha Po.	Outside Application Site (Mitigation Wetland)
50	Mangrove Skimmer *Orthetrum poecilops*	IUCN Red List: Vulnerable; Fellowes *et al.* (2002): GC;	Uncommon. Double Island, Lai Chi Wo, Nam Chung, So Lo Pun, Yim Tso Ha (Starling Inlet), Yung Shue au and Yung Shue O.	Outside Application Site (Mitigation Wetland)

6. IMPACT IDENTIFICATION AND PREDICTION

6.1 General

6.1.1 The project elements of the present application include the below:

- 11 residential buildings in R(E) with not more than 28 domestic storeys;
- Non-domestic portion consists of retail, covered transport lay-by, clubhouse and carpark at basement;
- Other associated landscape areas;
- Demolishment and relocation of the existing soy sauce factory to the south within the Application Site;
- Necessary accesses and EVA.

6.1.2 The potential impacts associated with the proposed development include:

- Direct habitat loss, either permanent or temporary, which may occur on-site and/or off-site, due to site formation and construction works;
- Direct impacts to flora and fauna species of conservation importance arising from mortality/injury;
- Disturbance impacts to surrounding habitats and fauna during construction;
- Water quality impact due to construction site runoff;
- Disturbance impacts to surrounding fauna, habitats and recognized sites of conservation importance during operation;
- Potential disturbance to flight paths of ardeids and other large-sized birds;
- Potential collision of birds;
- Night-time light impacts.

6.2 Impact Evaluation Criteria

6.2.1 The significance of ecological impacts has been evaluated based primarily on the criteria set out in Table 1 of Annex 8 of the Technical Memorandum for EIAO:

- Habitat quality;
- Species affected;
- Size/abundance of habitats/species affected;
- Duration of impacts;
- Reversibility of impacts; and
- Magnitude of environmental changes.

6.2.2 This assessment is based on the Master Layout Plan submitted under the current Application. Estimates of habitat loss and identification of areas to be affected by development have been calculated as accurately as possible.

6.3 Construction Phase

Direct Impact – Permanent Habitat Loss

6.3.1 The habitats within the Application Site under "R(E)" application will be directly impacted. None of these affected habitats is of considerable ecological importance.

6.3.2 The layout of the proposed residential development, reserved school, relocated soy sauce factory and associated facilities is shown in **Figure 7** and would be subject to detailed design. Assuming the whole site would be used, the estimated loss of area of each habitat type is summarized below in **Table 6.1**. The ecological values of the habitats are considered very low or low. It should be noted that the small section open channel at the southern tip of the site would be retained and no works are required.

Table 6.1 Estimated Habitat Loss within the Application Site

Habitat	Estimated Loss (ha)*	Ecological value
Channel	0	Low
Wasteland	0.53	Low
Plantation	0.58	Low
Developed area	6.99	Very low
Total	**8.10**	**Low**

Note: Habitat area are rounding off numbers.
The Channel would be retained, and no works required.

6.3.3 Due to the very low or low ecological values of developed area, plantation, and wasteland, the potential impact due to loss of those habitats is considered **insignificant**. Mitigation for the habitat loss is not required.

Direct Impact – Temporary Habitat Loss

6.3.4 There will be neither off-site works area nor temporary access for the construction works, and thus no temporary habitat loss is anticipated.

Fragmentation (habitats)

6.3.5 Fragmentation is the discontinuation in habitat that renders it a lowered attractiveness to flora or fauna or isolate populations of a species, potentially leading to reduced viability of a population. This is most easily seen in infrastructural links, where roads and rail lines break up habitat into smaller units, but also arises from disturbance impacts, where organisms avoid certain areas due to secondary impacts from nearby development. Where these prevent mobility of organisms, fragmentation has occurred.

6.3.6 Fragmentation of habitats may occur during construction phase, resulting in loss of ecological linkages between patches of habitats or habitats assemblages, especially in cases where construction of the development cuts through one habitat or between two areas of similar habitat with significant migration of fauna. The Application Site are currently dominated by habitats with low and very low value, and the areas to its north, northeast, east and south directions are also

mostly wastelands, developed areas or roads/highways. Movement of non-volant fauna (e.g. mammal, herpetofauna) through the Application Site is therefore limited under the existing condition due to the low value habitats, fence along the site boundary, as well as roads/highways to the east of the site. Hence, the potential impact due to habitat fragmentation is ranked as **insignificant**.

6.3.7 For birds, in particular waterbirds, due to the lack of sizable wetland habitat within the Application Site suitable for species that normally occur in significant numbers in Inner Deep Bay (larger ardeids, ducks, waders, Black-faced Spoonbill), the waterbird usage in the Application Site was low as described above. In addition, as the Application Site under "R(E)" application is at the fringe of the Deep Bay wetland area, with no significant areas of wetland to the north, northeast, east and south directions, it is not likely to have considerable ecological linkages with the Inner Deep Bay wetland area, or to be utilised by waterbirds to access their suitable wetland habitats. Hence, it is considered that indirect impacts (loss of ecological linkage) on the Inner Deep Bay wetland ecosystem as a result of this development would be **negligible**.

Fragmentation (flight-lines)

6.3.8 Typical flight-lines involve routes between feeding and roosting areas or between feeding and breeding areas (such as breeding ardeids at egretries or other roosting waterbirds). Development located on a flight-line may result in a decrease in the suitability of a foraging, breeding or roosting site by increasing the flight distance between sites.

6.3.9 In accordance with the flight observations recorded during the ardeid breeding season in 2019 and 2020, after taking off from TSL Egretry, the majority of ardeids flew along a general northward direction (flying across Yuen Long Highway and the Yuen Long Bypass Channel) with much smaller number flying eastward to Kam Tin River and westward to Yuen Long Town directions (**Figure 6c** and **6d**). For the breeding ardeids flying towards northern direction, after passing Yuen Long Highway, the majority of flight directions were towards Kam Tin River i.e. 39.22% and 58.33% in 2019 and 2020, respectively (**Figure 6e** and **6f**). None of the flight-lines passed through the Application Site. Other studies also reported ardeids have the tendency to follow waterways to reach their feeding grounds (see AEIAR-175/2013 & AEIAR-215/2017). In fact, TSL Egretry was abandoned in 2021. Potential impacts to the flight-line of breeding ardeids are therefore not expected.

6.3.10 Potential impacts to the breeding ardeids from the new egretry at Kam Po Road are not expected neither, as the observed flight-lines towards northwest direction were mostly along Kam Tin River (**Figure 6g**), and no ardeids taking off from the new egretry were observed flying through the Application Site. In addition, as the new egretry is over 2.2km southeast of the Application Site and there are abundant suitable wetland habitats near the egretry, potential impacts to the flight-line of breeding ardeids are not expected.

6.3.11 While the major flight-line of wintering birds was along Kam Tin River, only one occasional flight line was recorded to the north, with a patch of wasteland in between, and none was found within the Application Site. The proposed development within the Application Site is hence not an obstacle to the flight-line of wintering birds. Hence, the potential fragmentation impacts to breeding ardeids

at TSL Egretry, the new egretry, or other waterbirds from the proposed development are considered **insignificant**.

Indirect Impacts – Construction Noise

6.3.12 The construction activities, including excavation and piling during foundation works, demolition, materials loading/unloading, and concreting during superstructure works, have the potential to produce noise and cause disturbance to wildlife. In general, high level of disturbance could cause deterioration of habitat quality and a decrease of bird usage as well as subsequent decrease in wildlife density of the sensitive wetland habitats in the vicinity of the noise sources. Hence, the birds might move away to areas which are less disturbed and within their noise tolerances or reduce the foraging efficiency of birds that remain in the affected area. Wetlands in Deep Bay would have higher waterbird abundance during the wintering season. As such, the noise disturbance from construction activities of the proposed development on waterbirds is expected to be less significant in summer when migratory/overwintering waterbirds are not present.

6.3.13 Among the construction activities, piling is of particular concern. If any traditional percussive piling is performed without appropriate specific mitigation, it might have higher disturbance than other general construction activities, including site clearance/formation, superstructure or other quieter demolition/foundation methods, and might consequently cause a temporary decrease of waterbirds abundance near the works area.

6.3.14 Habitats potentially influenced by the proposed development involve open wetland habitats which include the abandoned ponds and ponds to the north, and the meander and Kam Tin River Drainage Channel to the west. Other wetlands with low potential to be disturbed include ponds in Nam Sang Wai area and YLBF Mitigation Wetland across Kam Tin River Drainage Channel. The mitigation wetland in Sha Po to the southeast of the Application Site is also of low potential to be influenced as separated by San Tin Highway.

6.3.15 Though the relatively higher diversity and abundance of overwintering waterbirds recorded in Kam Tin River Drainage Channel as well as other wetland habitats with higher waterbird diversity in the vicinity (ponds to the north in WCA, the Application Site is buffered from these higher value habitats by other habitats (such as the patch of wastelands to the north or the meander to the west), the impact from higher level of construction noise disturbance is considered **minor to moderate** for migratory/overwintering waterbirds and **minor** for the more tolerant waterbirds that are present all year if unmitigated.

6.3.16 The meander to the west of the Application Site, though have potential for low densities of wetland-dependent birds, had no significant records of waterbird usage and is of low ecological value. Hence, indirect impacts from construction phase are considered to be **minor**.

6.3.17 The Sha Po Wetland to the southeast of the Application Site is separated by highway and plantation. Hence, no indirect disturbance impact is predicted to this habitat. Likewise, the ponds in Nam Sang Wai area, YLBF Mitigation Wetland and YLBF are separated by Kam Tin River Drainage Channel which acts as a buffer against any potential disturbance from the Project. Hence, no indirect

disturbance impact is predicted for these wetland habitats.

6.3.18 For potential disturbance to TSL Egretry due to piling works and demolishing works of the existing soy sauce factory, the egretry is located about 1 km to the south of the Application Site and within this long distance, there are some existing sources of disturbance closer to this egretry including the highways, railways, village houses and other existing development e.g. Pok Oi Hospital and Long Shin Estate. It is therefore considered that the potential piling activities and demolishing works would not be the major source of disturbance comparing to these existing disturbance sources regardless of which piling and demolishing methods to be employed. Furthermore, TSL Egretry was found abandoned in 2021. Disturbance impact to the egretry is not expected.

Indirect Impacts – Dust

6.3.19 Dust will increase during construction phase, and might temporarily reduce the abundance and distribution of fauna in habitats adjacent to the works area.

6.3.20 Unmitigated construction works create significant levels of dust under certain weather conditions due to the construction vehicles and the phenomenon of wind-blown dust from works areas. The dust would be deposited on nearby habitats, which can cause vegetation damage and, as a secondary effect, have an impact on fauna such as insects and birds. Impacts from dust deposition of these types will, however, be temporary and reversible, and standard construction best practices as mitigation measures can be implemented to negate harmful impacts. Dust deposition impacts arising from the Project, therefore, are considered **insignificant**.

Indirect Impacts –Light glare

6.3.21 If the construction site has strong lightings or flood light, there may be night-time light impacts to nocturnal wildlife in the vicinity during any night time construction. However, nocturnal fauna recorded in the surroundings were limited to widespread flying mammal Japanese Pipistrelle and amphibians, and a common firefly species. According to the current construction methodology and programme, there will be no night time construction works for the Project. The construction site would only have limited lighting for security purpose. The impacts due to increased night-time light during construction will therefore be **insignificant**. Implementation of good site practices to maintain the security lighting angle would still be recommended to further minimise the impacts of the artificial lighting/glare as much as possible.

6.3.22 While there are no night-time works under the proposed development and the impacts of construction lighting/glare disturbance are considered insignificant for fauna species of conservation importance in the vicinity of the Application Site, ardeids habitually return to the night roost at every evening at around an hour before sunset and the construction activities (mainly construction noise and lighting for security) would potentially briefly interfere with the night roosts. However, the night roost of the ardeids at Kam Tim River is located at about 250m from the southern tip of the Application Site **(Figure 2b).** Moreover, there are already existing street lights along both the Yuen Long Highway and Castle Peak Road, and the constant traffic which are existing light sources much closer

to this night roost. Hence, the potential impact due to light from the construction of the Project is considered **insignificant**. For the cormorant night roost and the Bent-winged firefly habitat in Nam Sang Wai, given the long distance from the Application Site, impact on them due to light glare is unlikely.

Indirect Impacts – Water Quality and Site Run-off

6.3.23 Construction activities during the construction phase could generate surface run-off containing lubricants, chemicals and pollutants. The water bodies of the most concern include abandoned ponds, ponds, mitigation wetlands, channels and meanders and, ultimately, the Inner Deep Bay area into which all the runoff would discharge to. Construction runoff is potentially destructive to aquatic communities, which could be adversely affected should there be negative impacts on prey species.

6.3.24 Sediments may enter waterbodies via run-off, particularly during periods of heavy rain. This can lead to high turbidity from soil particles (which can block the gills of aquatic organisms) and eutrophication hence affecting the water quality. Aquatic macrophytes may be reduced as a result of reduced light penetration or increased free-floating algae populations following eutrophication. Severe eutrophication can lead to oxygen depletion and the impoverishment of aquatic communities, as well as animals that prey on them (e.g. waterbirds). Such effects would appear in the construction phase of a project, though it could also occur in the operation phase.

6.3.25 Construction site run-off, inappropriate stock piling of construction materials, and incorrect handling of construction chemicals may lead to indirect impact on water quality in the surrounding aquatic habitats (e.g. the channel within the Application Site and the meander in the vicinity) and associated fauna. Site run-off may carry sediments and lead to a temporary increase in local suspended solids for a short period of time. Chemical pollution (especially oil) would have higher impact to aquatic species subject to the quantity. The potential impact is ranked as **minor to moderate** if unmitigated. Potential impact due to site run-off will be minimized and controlled by measures under water quality impact assessment such as implementation of good site practice.

Impacts on recognized sites and species of conservation importance

Recognized sites of conservation importance

6.3.26 The Application Site is located at the periphery of the WBA, and other recognized sites of conservation importance (e.g. Mai Po Inner Deep Bay Ramsar Site, Wetland Conservation Area, Mai Po Nature Reserve, SSSI, Conservation Area, Priority Site and TSL Egretry) are either far away or separated by other land uses and hence and will not be affected.

6.3.27 The wetland habitats in Deep Bay area in particular those inside WCA serve as important feeding/roosting ground for migratory and overwintering waterbirds. The indirect disturbance in particular noise could cause a deterioration of habitat quality and a decrease of bird usage as well as subsequent decrease in wildlife density. The sensitivity of the wetland habitats would generally be considered higher during the peak visiting period of the migratory and overwintering birds i.e. dry season given the greater number of species of conservation importance affected.

6.3.28 Amongst the wetland habitats within the Study Area, of particular the Kam Tin River and WCA are located to the west and to the north of the Application Site. The wetland habitats in these two areas support a relatively greater diversity and abundance of migratory and overwintering waterbirds observed within the Study Area, but are buffered from the Application Site by a meander and some plantation, and also the wasteland to the north. The impacts of construction disturbance on the two areas are thus considered **minor** during dry season and **insignificant** during wet season if unmitigated.

Species of conservation importance

6.3.29 As the plant species of conservation importance i.e. *Aquilaria sinensis* was recorded beyond the Application Site, no direct impacts to this plant species are therefore expected.

6.3.30 No bird species of conservation importance found within the Application Site. The Application Site was of very low bird use. As birds are very mobile and there are more suitable habitats for the recorded bird species in the vicinity as well as in the Deep Bay area, the ecological impacts are considered **insignificant**, taking consideration of the habitat size and quality (i.e. low or very low ecological value) as well as disturbance when compared with the Deep Bay area.

6.3.31 While the indirect disturbance impacts of the construction activities (e.g. construction noise and increase in human activities), if unmitigated, might consequently cause the waterbirds to avoid using the habitats near the works area (including waterbirds feeding in Kam Tin River Drainage Channel and the ponds to the north). However, as these habitats are buffered from the Application Site by a meander and a patch of wasteland habitat, the potential of impacting these waterbirds outside the Application Site would be remote, and is considered **minor** for migratory/overwintering waterbirds and **negligible** for the more tolerant waterbirds that are present all year.

6.3.32 Nam Sang Wai area is an important roosting site for Great Cormorants. During winter, large roosting aggregations of Great Cormorants on the gum trees in the Nam Sang Wai fishpond area were often seen after feeding in Inner Deep Bay. Their roosting site in Nam Sang Wai however is far away and no roosting Great Cormorant was recorded within the Application Site. Hence, no impacts to roosting Great Cormorant are expected.

6.3.33 No mammal species was recorded inside the Application Site, with only one locally common and widespread mammal species i.e. Japanese Pipistrelle was recorded in the vicinity, i.e. in the patch of wasteland habitat to the north. Due to its mobility and commonness in Hong Kong, potential impacts to this species are not expected. Another mammal species of conservation importance i.e. Small Asian Mongoose was also recorded outside the Application Site and potential impacts to this species are also not expected. Eurasian Otter were not recorded within the Study Area. It is a semi-aquatic mammal which forages in water and nest on land. Recent records have only been found in the Mai Po Inner Deep Bay Ramsar Site and nearby region. Wandering individual might be possible but the chance of entering the Application Site would be very low due to the site location, site condition and disturbance. Hence, potential impacts from habitat loss and fragmentation on Eurasian Otter are considered **minor**.

6.3.34 As there will be no night works during construction phase, potential impacts of construction lighting/glare disturbance to the light-sensitive fauna including the ardeid night roosts next to Kam Tin River, the Great Cormorant roosting in Nam Sang Wai and the mammal species of conservation importance in the vicinity are insignificant as addressed in the sections on light glare above.

6.3.35 The other species of conservation importance recorded outside the Application Site including butterflies and dragonflies were recorded away from the proposed development, and hence will not be affected significantly. Besides, the breeding location of Oriental Magpie will not be affected.

6.4 Operational Phase

Direct Impact – Habitat loss

6.4.1 Operational phase direct impacts would be the habitats permanently occupied by project elements during operation, and in this case it will be the same size as the works area during construction phase. It is considered as **insignificant** and no additional habitat loss will occur during operational phase.

Direct Impact – Fragmentation to wetland habitats

6.4.2 The Application Site is dominated by developed area, which is with very limited use by wetland-dependent fauna. The Application Site is located at the edge of the Deep Bay wetland area, with no significant areas of wetland or other habitats of considerable ecological value in the immediate vicinity at most directions (the northeast, east, and southeast). No significant barrier to fauna movement and no breakage of linkage within wetland habitats in the Deep Bay Area are anticipated during the operation phase. The potential indirect impacts of habitat fragmentation during operational phase will be **insignificant**.

Direct Impact – Fragmentation to flight-line of waterbirds

6.4.3 As discussed in the construction phase impact, the flight-line surveys conducted in the breeding seasons of 2019 and 2020 as well as 2021 revealed that no breeding ardeids were observed passing through the Application Site. and only one occasional flight line was found to the north with a patch of wasteland habitat in between during winter flight-line survey. Hence, the potential fragmentation impacts to breeding ardeids from TSL Egretry or the new egretry at Kam Po Road is not expected, and on other waterbirds from the proposed development are considered **insignificant**.

Indirect Impact – Human Disturbance

6.4.4 In a wider context, the immediate vicinity along San Tin Highway including the current Application Site, the soy sauce factory in the south, Wing Kei Tsuen, Mo Fan Heung and Pok Wai Village etc., had mostly been developed or are existing wasteland. The Application Site is adjacent to San Tin Highway; therefore, the current development is considered as compatible with the nearby land use. Although the north and west of the Application Site consists of rural areas, the ecological values of the habitats on the north (abandoned ponds and ponds) and west (Kam Tin River) are rated as low to medium to medium, the proposed residential development within the Application Site would only have low level of

disturbance impact to these habitats during the operational phase, given that residential development has low disturbance in nature. The operation of the soy factory would not produce significant noise nor traffic.

6.4.5 Hence, it is anticipated that any impacts of increased disturbance to these sites will be **minor**.

6.4.6 Fence elements in a form of planting strip/fence walls/any appropriate form will be established at the periphery of the Application Site. The fence elements will form a buffer which is anticipated to reduce potential noise, traffic and other human disturbance. The fence elements will help to act as a buffer between the proposed development and adjacent land uses and is a building set back from the WCA.

Indirect Impact – Water Quality

6.4.7 There could be potential indirect impacts to the water quality of the surrounding waterbodies from surface run-off and pollution events from the development and their associated infrastructure. This nonpoint pollution, such as stormwater washed off from areas of hardstanding, roads and landscape area (which may contain fertilizers and pesticides) may have various impacts to the local aquatic environment. Magnitude of impacts would depend upon the pollution type and quantity of pollutant. Increased stormwater runoff may also lead to increased siltation if there are areas with bare soils.

6.4.8 The proposed development however is a residential development and relocation of soy sauce factory. Pollutants on road surface would be very limited, and significant bare grounds will be unlikely. The built-in structures of the drain system within the Application Site such as sand trap could also help isolate and collect sediment and pollutants. The relocated soy sauce factory is to be discharged according to the existing discharge license possessed by the existing soy sauce factory issued by the EPD. The wastewater from the relocated soy sauce factory will be treated by new on-site sewage treatment plant, based on latest treatment technology designed for soy sauce production process. The treated effluent will be discharged into the new stormwater drainage system. The risk of accidental discharge would be minimal. Point pollution would not be an issue for the proposed development as the sewerage will collect all domestic effluent and organic load. It is anticipated that any impacts of water quality changes will be **insignificant**.

Indirect Impact – Light glare

6.4.9 While the wildlife in the surrounding areas would be tolerant with night-time light given the existing highway viaduct and other roads with overnight traffic lighting, there are concerns on potential light impact on night roost of ardeids at Kam Tin River, the Cormorant Night Roost in Nam Sang Wai, and the Mai Po Bent-winged Firefly habitat at Shan Pui River and Kam Tin River meander. The habitats of Cormorant night roost and Mai Po Bent-winged Firefly are located at over 500m and 1km respectively from the Application Site, and the potential of such an impact would be remote and minor given the long separation distances.

6.4.10 For the night roosts of the ardeids at Kam Tin River, they are located at positions

slightly below the Yuen Long Highway viaduct and about 250m from the Application Site. Since the Yuen Long Highway viaduct is located between these night roosts and the Application Site and is very close to the night roost, the night roosts are largely within the shadow zone of the viaduct such that the viaduct could block most light to these night roosts from the Application Site. Moreover, there are already existing street lights along both the viaduct and Castle Peak Road and the constant traffic which are existing light sources much closer to these night roosts. In addition to the distance and the existing overnight light level caused by the highway viaduct, there are also many known examples of bird night roost/nesting locations located much closer to existing light sources, including the egretries at Mai Po Village and Tai Po, and also the Collared Crow in Shuen Wan Restored Landfill. The potential of light impact on the night roost of the ardeids at Kam Tin River is considered **minor**. As a precaution, avoidance of unnecessary external lighting is recommended.

Direct Impact – Bird Collision

6.4.11 Bird collision risk would be more prominent when the building consists of extensive reflective glass façade such that the birds flying nearby are confused by the reflected image inside the glass which is normally the image of the sky and/or nearby environment. Though usually occur on small-sized birds of higher speed, there might still be an increased risk of collision with structures constructed on or close to major flight-lines. Considering that the current residential development and relocated soy sauce factory would not have extensive glass façade, the relocated soy sauce factory will be not more than 8m high (same as the existing soy sauce factory), and no breeding ardeid flight lines across or near the Application Site, only occasional winter flight lines were observed. The maximum building height of the residential tower is 115.0 mPD. The range of the building height of the residential towers is 58.0 mPD (14 storeys) to 115.0 mPD (29 storeys). The tallest buildings would be located in the eastern most of the Application Site which are farthest from the rural areas in the west. Since there would not be continuous and extensive reflective glass façade for the residential towers, the potential bird collision impact is considered **minor**.

Impact on recognized sites and species of conservation importance

Recognized sites of conservation importance

6.4.12 The Application Site is located at the periphery of the WBA. The proposed development will not affect the ecological integrity of the wetlands within WCA or cause direct habitat loss in WCA. Only small area of low or very low ecological value within WBA will be permanently lost and hence is considered insignificant. While the habitats in WCA is currently separated by a patch of wasteland habitat from the Application Site. The operational phase disturbance (e.g., noise, human disturbance) will be very limited.

Species of conservation importance

6.4.13 The Study Area is already subjected to human disturbance, and the fauna within the Study Area are considerably habituated to human disturbance. No additional ecological impacts are expected further to the evaluation for the construction phase.

7. MITIGATION OF ECOLOGICAL IMPACTS

7.1 General

7.1.1 According to the principles in the TM-EIAO Annex 16 and EIAO Guidance Note 3/2010, ecological impacts on important habitats and the associated wildlife caused by the proposed Project should be avoided, minimized and mitigated where practicable.

7.1.2 The potential impacts arising from the construction and operation of the proposed development have been assessed. Since most of the potential ecological impacts are of low or insignificant levels (except for the disturbance arising from piling and potential site runoff), specific ecological mitigation measures are not required for most impacts.

7.2 Avoidance

7.2.1 The Application Site is located at the periphery of the WBA and is away from the WCA (**Figure 2a**). The Application Site has avoided habitats of higher ecological values, or other natural habitats. Only man-made/disturbed habitats of very low and low ecological value, including developed area, a section of narrow channel, plantation and wasteland will be affected.

7.3 Minimization

Piling Methods and Programme

7.3.1 Although the types of foundation work would be subject to detailed ground investigation in the later stage, piling foundation would likely be required for the current development. While construction noise impact would be minor between Apr – Sep which is outside the sensitive overwintering bird season, as a conservative approach to minimise the noise disturbance to migratory birds using Kam Tin River and sites of conservation importance (i.e., WBA), percussive piling would be avoided between Oct – Mar unless the noise level could be demonstrated to be acceptable. During the detailed design stage, alternative quieter piling method (e.g., bored piling), quieter percussive piling method (e.g., hydraulic hammering), piling period and timing will be investigated. Traditional steel hammer percussive piling would be avoided. Should quieter percussive piling method be required and proposed for certain buildings during Oct – Mar, a piling plan including a trial pile assessment by specialist consultants or contractors would be conducted before commencement of any percussive piling construction works between Oct – Mar to demonstrate the feasibility of adopting such method without significant disturbance to the winter birds. The piling plan will be submitted to AFCD or the TBP for approval prior to the trial pile assessment.

At-source Mitigation and Site Hoarding

7.3.2 Various at-source mitigation measures are available and could be adopted for reducing piling noise, for example custom-made capsule, insulation wrap and noise enclosure, etc. Besides, site hoarding would be erected along the construction site boundary and 3m tall temporary noise barrier would be provided. Together with general good site practices which would be undertaken during the

construction phase, potential disturbance to the wildlife inhabiting nearby areas could be minimized to acceptable levels.

Good Site Practices

7.3.3 To minimise the contamination of wastewater discharge, accidental chemical spillage and construction site run-off, the below general good practices should be adopted:

- The good site practices outlined in ProPECC PN 1/94 "Construction Site Drainage" should be followed to minimize surface runoff;
- Surface run-off from construction sites should be discharged into storm drains via adequately designed sand / silt removal facilities such as sand traps, silt traps and sedimentation basins;
- Open stockpiles of construction materials (e.g. aggregates, sand and fill material) on sites should be covered with tarpaulin or similar fabric during rainstorms;
- Good construction and site management practices should be observed to ensure that litter, fuels and solvents do no enter the storm water drains;
- Chemical toilets should be provided within the construction site and properly maintained. All effluent discharged from the construction site should comply with the standards stipulated in the "Technical Memorandum on Standards for Effluents Discharged into Drainage and Sewerage Systems, Inland and Coastal Waters" (TM-DSS)

Fence Elements around the Application Site and the Proposed Developments

7.3.4 The proposed fence elements would be in the form of planting strip/fence walls/any appropriate form. This proposed fence elements would serve as a buffer to shield potential noise, traffic and other human disturbance from the Projects to the surrounding environment during the operational phase.

7.4 Precautionary Measures

Good Practice of Lighting

7.4.1 Although mitigation measures would not be required for the potential light glare impact, it is recommended to maintain the security lighting angle during construction phase and avoid unnecessary external lighting during operational phase to further minimize any potential disturbance.

7.5 Residual Impact

7.5.1 With the abovementioned mitigation measures, no secondary/induced/additional/synergistic impacts, or residual impacts are anticipated. A summary of the impacts in construction and operational phases, with sources, receivers, nature, significance and mitigation required, are provided in **Table 7.1**.

Table 7.1 Summary of Construction Phase and Operational Phase Impacts

Impact	Sources	Receivers	Nature of impacts						Significance of ecological impact	Mitigation required
			Habitat quality	Species affected	Size / abundance	Duration	Reversibility	Magnitude		
Construction Phase										
Habitat loss during construction	Works areas within the Application Site	Habitats within the Application Site: developed area, plantation and wasteland	Low or very low	Low abundance and diversity of wildlife	8.10 ha (The section of narrow channel of 0.05 ha will be retained)	During construction phase	Not reversible	Low	Insignificant	Not required.
Fragmentation (habitats)	Works areas within the Application Site	Adjacent habitats; Wetlands of Deep Bay area	Low for the surrounding habitats; Medium or high for Deep Bay area	Low abundance and diversity of wildlife in the surrounding	Vary	During construction phase	Not reversible	Low	Insignificant for adjacent habitats; negligible for Deep Bay wetlands	No
Fragmentation (flight-lines of waterbirds)	Construction of high-rise buildings in the residential portion	Waterbirds in particular breeding ardeids in TSL Egretry and Kam Po Road Egretry	Vary with habitat types	Waterbirds in particular breeding ardeids	Vary	During construction phase	Not reversible	Low	Not expected for TSL Egretry and Kam Po Road Egretry Insignificant for winter waterbirds	No
Construction noise	Construction works with higher disturbance level such as piling and demolishing of existing soy sauce factory	Sensitive habitats in the area, which are buffered by other habitats of lower ecological value	Vary with habitat types	Mainly waterbirds	Vary	Temporary	Reversible	Moderate	Minor to moderate for migratory/ overwintering waterbirds in Kam Tin River Drainage Channel and ponds to the north; minor for the more tolerant waterbirds; Minor for wetlands with lower waterbird use; Not expected for TSL egretry	- Steel hammer percussive piling would be avoided - Alternative quieter piling method(s). - Percussive piling foundation method would be avoided in the dry season unless the noise level could be demonstrated to be acceptable. - Piling plan and trial assessment by specialist consultants/ contractors to be submitted to AFCD for agreement prior to adopting percussive piling foundation method in the dry season. - 3m tall temporary noise barriers and various at-source mitigation measures.
Dust	Construction works and demolishing of existing soy sauce factory	Sensitive habitats near the works area	Vary with habitat types	Flora and fauna in habitats adjacent to the works area	Vary	Temporary	Reversible	Low	Insignificant	Standard construction best practices
Light glare	Lighting in works area	Sensitive habitats near the works area	Vary	Nocturnal fauna including firefly, night roost of ardeids and Great Cormorant	Vary	Temporary	Reversible	Insignificant	Insignificant for nocturnal fauna and ardeid night roosts. Not expected for the cormorant night roost and Bent-winged firefly habitat	No night time works planned. Maintain security lighting angle

Impact	**Sources**	**Receivers**	**Nature of impacts**						**Significance of ecological impact**	**Mitigation required**
			Habitat quality	**Species affected**	**Size / abundance**	**Duration**	**Reversibility**	**Magnitude**		
Water quality and site run-off	Construction works and demolishing of existing soy sauce factory	Wetland habitats (e.g. meander and channel)	Vary	Aquatic fauna and wetland dependent species	Vary	Temporary	Reversible	Moderate	Minor to moderate	Follow water quality mitigation measures
Impacts on recognized sites of conservation importance	Construction works, demolishing of existing soy sauce factory	Wetland habitats within the Study Area, of particular note is the Kam Tin River and WBA	Vary	Inhabiting wetland species	Vary	During construction	Not reversible	Low	Minor during dry season and insignificant during wet season	Addressed in the above measures.
Species of conservation importance	Construction works, demolishing of existing soy sauce factory	Mobile faunal species of conservation importance	Vary	Bird species of conservation importance and Eurasian Otter	Vary	During construction	Not reversible	Low	Insignificant during dry season and negligible during wet season	No
Operational Phase										
Habitat loss during operation	The proposed development	Area occupied by the development	low or very low	Low abundance and diversity of wildlife	8.10 ha Same as construction phase, no additional habitat loss	Permanent	Not reversible	Low	Insignificant	No
Fragmentation (habitats)	The proposed development	Adjacent habitats; Wetlands of Deep Bay area	Low or low to medium for the surrounding habitats; Medium or high for Deep Bay area	Abundance and diversity of wildlife in the surroundings low except KTRMDC	Vary	Permanent	Not reversible	Low	Insignificant	No
Fragmentation (flight-lines of waterbirds)	High-rise buildings in the residential portion	Waterbirds in particular breeding ardeids in TSL Egretry and Kam Po Road Egretry	Vary with habitat types	Waterbirds in particular breeding ardeids	Vary	Permanent	Not reversible	Low	Not expected for TSL Egretry and Kam Po Road Egretry Insignificant for winter waterbirds	No
Human disturbance	Residents of the proposed development and operation of relocated soy sauce factory	Habitats near the Application Site	Vary with habitat types	Terrestrial fauna including those species of conservation importance	Vary	Long term	Reversible	Low	Insignificant	Appropriate fence elements to screen out any potential noise.
Water quality	The proposed development and operation of relocated soy sauce factory	Wetland habitats (e.g. meander, channel)	Vary	Aquatic fauna and wetland dependent species	Vary	Long term	Reversible	Insignificant	Insignificant	No
Bird collision	The proposed development and operation of relocated soy sauce factory	N/A	N/A	Birds	Vary	Permanent	Not reversible	Low	Minor	No
Light glare	The proposed development and operation of	Night roosts of ardeids and cormorants,	Vary	Roosting ardeids and Great Cormorant, firefly	Vary	Permanent	Reversible	Insignificant	Minor	Precautionarily avoid unnecessary external lighting

Impact	**Sources**	**Receivers**	**Nature of impacts**						**Significance of ecological impact**	**Mitigation required**
			Habitat quality	**Species affected**	**Size / abundance**	**Duration**	**Reversibility**	**Magnitude**		
	relocated soy sauce factory	firefly habitats								
Impacts on recognized sites and species of conservation importance	The proposed development and operation of relocated soy sauce factory	wetland habitats within the Study Area, of particular note is the Kam Tin River, WBA and WCA	Vary	Wetland species	Vary	Permanent	Not reversible	Low	Not expected	Addressed in the above measures.

8. CUMULATIVE IMPACT

8.1.1 It is the general practice for EcoIA to consider confirmed (i.e. approved) concurrent projects that are within the 500m Study Area. For those planning projects which were within the 500m Study Area but withdrawn or no approval status, it is considered not appropriate to include those projects as concurrent projects for the purpose of this cumulative impact assessment.

8.1.2 The combination of various concurrent developments (other planned and committed development projects) in the area may potentially lead to cumulative impacts, particularly on habitat loss, increased road use and disturbance impacts. For planning projects which were within the 500m Study Area, the approved projects will be included for the purpose of assessing the cumulative impacts. The concurrent projects in the area identified in accordance with the best available information include the following:

Residential Development – Approved Planning Application A/YL-NSW/274

8.1.3 This project is located at approximately 800m to the southwest of the current Application Site. It is a residential development with 5 nos. of 19-storey towers and 2 nos. of 6-storey towers. This proposed development would not cause any wetland loss as it is currently wasteland habitat only. A landscape area with natural habitat and water feature is proposed on the northeast corner of this development mainly to retain flight lines for ardeids from TSL Egretry (however the Tung Shing Lane Egretry was found abandoned in 2021). A light assessment conducted for this project showed that the predicted increase in light intensity by this project would be +0.01 Lux at the nearest point of the known Mai Po Bent-winged Firefly habitat is Nam Sang Wai and there would be no significant increase (i.e., +0.00 Lux) in light level for the majority of the firefly habitat extent. In view of the minor increase contributed by this project, no significant cumulative night time light impact to the firefly habitat is anticipated.

Comprehensive Development with Wetland Enhancement at Nam Sang Wai and Lut Chau – Approved Planning Application A/YL-NSW/242

8.1.4 This project is a comprehensive development with residential buildings at the southwest side of Nam Sang Wai, as well as wetland enhancement in the remaining part of the Application Site in Nam Sang Wai and Lut Chau. The residential area would be located at over 800m to the west of the current Application Site. It is a residential development with 2,521 housing units comprising a mixture of three-storey houses and apartment blocks ranging from 19 to 25 residential storeys. In accordance with the EcoIA for A/YL-NSW/242, this proposed development would not cause any loss of "net wetland area". Enhancement plan is proposed on the rest of Application Site in Lut Chau and Nam Sang Wai.

Existing and Planned Developments in Kam Tin North

Residential Development – Approved Planning Application A/YL-KTN/118-2, A/YL-KTN/663, A/YL-KTN/604

8.1.5 An approved comprehensive residential development of approx. 28 ha in total lies to the southeast of the current Project outside the WBA (Application No. A/YL-KTN/118-2). It is a phased development and is now partially completed. One of the potential ecological impacts from the approved project relate to the globally near-threatened dragonfly Four-spot Midget *Mortonagrion hirosei*, the loss of a large area of fish ponds and some loss of grassland/shrubland, and resultant impacts on a number of wetland-dependent fauna and flora of conservation importance. To mitigate for these, a mitigation wetland to include Sha Po Marsh, which is of importance to the damselfly, had been proposed adjacent to the residential portion and successfully implemented by the private developer. In addition, two mitigation ponds were created at the entrance of the development for other impacted species.

Residential Development – Approved Planning Application A/YL-KTN/319-2

8.1.6 An approved residential development project lies to the west of the Kam Tin River (Application No. A/YL-KTN/319-2). This project (now completed as The Riva) involves buildings of up to 23 storeys and is sandwiched between Ko Po Road to the north and Kam Tin Road to the south outside of the Study Area. Habitats impacted comprise largely open storage and patches of waste ground or grassland/shrubland.

8.1.7 No wetland was lost as a result of the Project and no particular ecological mitigation measures are proposed.

Disturbance

8.1.8 Since the Planning Application No. A/YL-NSW/274 has been approved on 26 Feb 2021, the implementation programme of A/YL-NSW/274 will be earlier than this subject application. Concurrent piling works of two developments would be unlikely. Other construction disturbance caused by the development works of A/YL-NSW/274 would be low in magnitude and will be resolved by the mitigation measures recommended under its EcoIA study. Impacts during the construction phase of the subject application will also be mitigated by measures recommended in Section 6 of this report. Hence the cumulative impact from these is not anticipated to be significant.

8.1.9 For the potential cumulative impacts from the operational phase, noise, dust and human activities will not be significant as both applications are residential developments and most activities of residents will be indoors. Also, the Application Site is separated from the Bent-winged Firefly habitat by the channel of Kam Tin River. The firefly habitat and Great Cormorant night roost in Nam Sang Wai are situated to the west of the Application Site outside of the 500m Study Area. The night-time lighting from the approved application No. A/YL-NSW/274 will mainly be the domestic indoor lighting, and hence any spillover light would be insignificant. There would not be external and directional night-time light source pointing toward the firefly habitat. Hence, cumulative night-time lighting from two developments is anticipated to be insignificant.

8.1.10 The proposed low-density development under Approved Application No. A/YL-NSW/274 is situated about 500m to the north of the TSL Egretry. A/YL-NSW/274 would not cause any loss of wetland. Although the current Application would require deck over of a section of narrow channel, the functions of the channel connecting

the Sha Po Marsh would not be affected. No net loss of wetland is anticipated. Currently, both sites are mainly covered by habitat of low ecological value (wasteland and developed area) and to some extent disturbed by human activities. While the layout plan of A/YL-NSW/274 has taken into account the flight lines of breeding ardeids from TSLEgretry by provision of landscape area at the northeast corner of the development site (though the TSL Egretry was found abandoned in 2021), there is no breeding ardeid flying across the Application Site. Hence it is not anticipated to have significant cumulative impacts.

Fragmentation

8.1.11 The potential of cumulative fragmentation caused by the above mentioned concurrent proposed developments on habitats is remote, as these concurrent projects, while outside and far away from the Application Site, are mostly located at existing developed areas or separated from each other. Cumulative fragmentation impact is thus considered to be minor.

Water quality

8.1.12 During the operational phase, the surface water run-off of the above mentioned proposed concurrent developments will pass into respective stormwater drainage systems which will prevent most run-off from entering and affecting nearby streams and ultimately Inner Deep Bay similar to other normally operating stormwater drainage systems in the area. Ecological impact would therefore be minor.

8.1.13 In summary, these concurrent projects are either over 500m distance from the Application Site, or separated by the Yuen Long Highway and Kam Tin River, the potential of cumulative impacts are mostly low. There will be no wetland loss from all these concurrent projects (and wetlands are even created in some projects). For the nearest concurrent project, quieter piling method would be employed for A/YL-NSW/274, and thus unlikely to have cumulative impact. Other impacts from these concurrent projects will be respectively mitigated and reduced to low levels. Cumulative impacts are not predicted.

9. CONCLUSIONS

9.1.1 Within the Application Site, developed area, plantation and wasteland will be lost directly. Due to the very low or low ecological values of these habitats, the potential impact due to loss of those habitats is considered insignificant.

9.1.2 This EcolA demonstrates that the proposed development would not have significant disturbance impacts to the surroundings including wetlands inside WCA, and will not affect the buffer functions of the WBA, and is thus in line with the Town Planning Board Guideline No. 12C (TPB Guideline No. 12C) "Application for Developments within Deep Bay Area".

1. INTRODUCTION

1.1 Project Background

1.1.1 The Application Site currently falls within the "Industrial (Group D) ("I(D)"), "Open Storage" ("OS") and 'Road' zones in Yuen Long. The Applicant proposed to rezone from "I(D)", "OS" and 'Road' zones to "Residential (Group E)" ("R(E)") zone in support of a comprehensive development, reserved school site and relocated soy sauce factory (name "R(E) Site") (Application No. Y/YL-NSW/9).

1.1.2 There is another planning application for rezoning the "Other Specified Uses (Comprehensive Development to Include Wetland Restoration Area)" zone ("OU(CDWRA)") to "OU(CDWRA)1" zone for comprehensive development to the north of the Application Site and is submitted under separate submission (name "OU(CDWRA)1 Site") (Application No. Y/YL-NSW/8).

1.1.3 Both the proposed developments at the Application Site and adjacent site are tentatively completed at the same time so that both developments are considered together for planning of the infrastructure.

1.1.4 Ramboll Hong Kong Limited is commissioned to provide quantitative air ventilation assessment (AVA) consultancy services for the proposed development.

1.2 Application Site and its Environs

1.2.1 The Application Site of about 81,550 sq.m is currently zoned "I(D)", "OS" and 'Road' under the Approved Nam Sang Wai Outline Zoning Plan (No. S/YL-NSW/8).

1.2.2 The Application Site is bounded by Castle Peak Road – Tam Mi section, San Tin Highway and Tsing Long Highway to the east. The area to the immediate north is zoned as "OU(CDWRA)".

1.2.3 To the immediate southwest is an existing meander zoned "Open Space" ("O"). Kam Tin River is situated on west side.

1.2.4 Most of the Application Site is vacant except a parcel on east side immediate to Castle Peak Road – Tam Mi which is now occupied as sawmill. Moreover, an existing channel of 3m width is aligned on the southern side of the Application Site which was formed under the project titled Rural Drainage Rehabilitation Scheme, Stage 2 Phase 3 – Mo Fan Heung Stream Rehabilitation. Water ponds and watercourse were observed at the east of the Site.

1.2.5 The surrounding area to the north, west and southwest is mainly wetland, river and meander. To the northeast situates a vehicle repair use, and further northeast with village type developments (Wing Kei Tsuen ~+13.1mPD to +15.3mPD) and open storage. The area to the east and southeast separated by heavy trafficked road includes Mo Fan Heung (~+9.8mPD to +28.9mPD) and Fung Kat Heung (with factory and open storage uses and some scattered houses). To the further southeast is Sha Po Tsuen (~+15.3mPD).

1.2.6 **Figure 1** shows the location of the Application Site and its environment.

1.3 Baseline Scenario

1.3.1 The Baseline Scenario refers to approved Master Layout Plan (MLP) under the Planning Application No. Y/YL-NSW/3. Under the Baseline Scenario, a total non-domestic gross floor area of not more than 57,890m² and a maximum building height (BH) of about +46mPD. The plan of the Baseline Scenario is shown in **Appendix 1**.

1.4 Proposed Scenario of Application Site

1.4.1 The Master Layout Plan (MLP) of the Proposed Scenario is shown in **Appendix 2**. The Application Site comprises 11 towers (T1 to T12, T4 omitted), relocated soy sauce factory portion and reserved school site. Proposed development with maximum building height of not more than +115mPD, and the development site area is about 46,501m^2 (PR not more than 2.73).

1.4.2 The Proposed Scenario fully respects the planning consideration in respect to air ventilation. Various building separations and building setbacks are incorporated in the proposed development.

1.4.3 Under the Proposed Scenario of the Application Site, various building separations and building setbacks which could serve as air corridors are proposed between the tower blocks and along the site boundary. Based on the current scheme, building separations of about 15m between T11/T12, about 47m building separation between T9/T10, and about 28m building separation between T9/T2 are provided. There is about 15m building separation against the soy sauce factory building. These building separations will act as local air paths for wind penetration to the surroundings. The building setback of T6 and T1 away from Application Site eastern site boundary are about 14m and about 17m respectively. Under the current scheme of Proposed Scenario at OU(CDWRA)1 Site, the building separations of about 15m are provided between T23/T25, T17/T18, and T8/T27. There are also building separation are provided between T5/T6 (about 20m), T11/T20 (about 28m), and T3/T12 (about 38m). The building setback are about 30m and about 10m away from OU(CDWRA)1 Site northern and eastern site boundaries respectively.

1.5 Evaluation Scenarios

1.5.1 Overall, three scenarios are evaluated under this AVA. The assumptions of respective scenarios are summarised as below:

- Baseline Scenario: Approved Scheme of Application No. Y/YL-NSW/3 (for hotel) within the Application Site and Approved Scheme of Application No. A/YL-NSW/241 (for outlet mall) within the OU(CDWRA)1 Site

- Proposed Scenario 1 (**Appendix 2**): Under this scenario, only the Proposed Scheme for the proposed "R(E)" zone would be implemented.

- Proposed Scenario 2 (**Appendix 3**): Under this scenario, both of the Proposed Schemes for the proposed "R(E)" zone and the adjacent proposed "OU(CDWRA)1" zone (under separate submission) would be implemented.

2. SITE WIND AVAILABILITY

2.1 Site Wind Availability Data

2.1.1 According to the Planning Department's website, a meso-scale Regional Atmospheric Modeling System (RAMS) was used to produce a simulated 10-year wind climate at the horizontal resolution of 0.5 km x 0.5 km covering the whole territory of Hong Kong. The simulated wind data represent the annual, winter and summer wind condition at various levels, i.e. 200 m, 300 m, and 500 m above terrain.

2.1.2 It is considered as an acceptable starting point to use the simulated RAMS data for site wind availability. Based on the location of the Application Site, the RAMS data of the grid (X: 055, Y: 073) has been extracted from the Site Wind Availability Data of Planning Department's website.

2.1.3 **Figure 2** shows the relevant windrose diagrams (at 500 m) representing the frequency and wind speed distribution of the district concerned for both summer and annual conditions. The simulated windroses have indicated that the local area is dominated by winds from NNE to SSW accounting for approximately 82.3 % of all winds that occur at the Application Site. On the other hand, the summer wind mainly comes from ESE to WSW contributing 76.3% of all winds that occur at the Application Site.

Table 2.1 Summary of RAMS Data and Wind Direction at 500m

Wind Direction	Probability for Annual Condition (%)	Probability for Summer Condition (%)
N	2.7%	1.5%
NNE	**7.9%**	1.8%
NE	**7.8%**	1.4%
ENE	**9.1%**	2.3%
E	**15.4%**	5.6%
ESE	**10.7%**	**8.4%**
SE	**7.9%**	**7.8%**
SSE	**7.6%**	**8.7%**
S	**7.8%**	**14.4%**
SSW	**8.1%**	**17.0%**
SW	5.8%	**14.0%**
WSW	2.8%	**6.0%**
W	2.4%	4.8%
WNW	1.3%	2.4%
NW	1.2%	2.0%
NNW	1.5%	1.7%
Total Selected	**82.3%**	**76.3%**

Note: Bolded characters highlighted in grey represent the selected prevailing wind directions for evaluation.

2.2 Topography and Building Morphology

Topography

2.2.1 The Application Site is located in the inland Yuen Long area. The surrounding is topographically flat. To the further northeast side of the Site is Kai Kung Leng and Tai Lam Country Park. The influence of local topography to the wind flow pattern around the Site is minimal due to long separation.

2.2.2 From north to west of the Application Site is open spaces and Kam Tin River, it is expected that annual and summer NNE to SE and S to SW prevailing winds can penetrate the Application Site and reach its downstream areas. Thus, the existing site wind availability is anticipated to be satisfactory. The influence of local topography to the wind flow pattern around the Application Site is minimal.

Building Morphology

2.2.3 Under the existing condition, the building density of the surrounding is considered as low. The surrounding areas are either abandoned fishpond or erected with low-rise buildings including scattered development such as Mo Fan Heung, Fung Kat Heung, Sha Po Sewage Pumping Station and some temporary building structures located to the east and southeast of the Application Site.

2.2.4 To the immediate north where another proposed development (also named "OU(CDWRA)1 Site") situated. Therefore, potential building blockage effect due to the surrounding developments are considered as low.

2.2.5 It is confirmed that the elevated structures, planned and committed developments have been modelled in the simulation and shown in **Figure 1**.

2.3 Planned and Committed Development

2.3.1 The planned and committed developments are listed in table below and also shown in **Figure 1**. The information of the planned and committed development is provided in **Appendix 6**.

2.3.2 Under the Baseline Scenario, it consists of approved Planning Application No. A/YL-NSW/3 (for hotel) at the Application Site and approved Planning Application No. A/YL-NSW/241 (for outlet mall) at OU(CDWRA)1 Site.

2.3.3 In addition, as mentioned in **Section 1.1.2**, the air ventilation impacts of the Proposed Scenario of the Application Site would be assessed without and with the Proposed Scenario of OU(CDWRA)1 Site (Application Y/YL-NSW/8). The Proposed Scenario 1 consists of the Proposed Development at the Application Site, relocated soy sauce factory, and approved Planning Application No. A/YL-NSW/241 (for outlet mall) at OU(CDWRA)1 Site.

2.3.4 The Proposed Scenario 2, Proposed Development at the Application Site and OU(CDWRA)1 Site would be incorporated. The MLP of the Proposed Scenario at OU(CDWRA)1 Site (Proposed Scenario 2) is shown in **Appendix 3**. The layout of OU(CDWRA)1 Site comprises 24 towers (T1 to T28, T4, T13, T14 and T24 omitted) with building height ranging from +61.5mPD to +115mPD. Two 2-storey clubhouse buildings (+18.5mPD) will be built at the opposite of T2 and T15. A 2-storey building for GIC facilities (+14.7mPD) will be built at the northeastern side of the OU(CDWRA)1 Site.

Table 2.2 Planned and Committed Development within Surrounding Area

Planning and Committed Development
• Approved Planning Application No. A/YL-NSW/241 (for outlet mall) (Baseline Scenario and Proposed Scenario 1) • Planning Application No. Y/YL-NSW/8 (Proposed Scenario 2) • Relocated soy sauce factory portion* • Reserved school site in the current "OS" zone* • Approved Sha Po Public Housing Development under the Approved Kam Tin North OZP no. S/YL-KTN/11 • LSPS application no. LSPS/002 endorsed by CE in C in November 2022 • Approved Planning Application Y/YL-NSW/7 • Approved Planning Application A/YL-NSW/274 • Proposed Au Tau Station of the Northern Link

**No layout is available in public domain; layout is prepared by Project Architect for this study based on the Hong Kong Planning Standards and Guidelines (HKPSG)*

3. QUANTITATIVE ASSESSMENT METHODOLOGY

3.1 Assessment Area

3.1.1 The Assessment Area is determined by the height (H) of the highest building within the Assessment Area (i.e. The Proposed Development with a maximum building height of about 110 m) and usually covers an area of 1H from the site boundary as required in *Technical Guide*. In order to assess the cumulative impact on the pedestrian wind environment with the presence of proposed developments at both OU(CDWRA)1 Site and R(E) Site, the Assessment Area and Surrounding Area are extended. **Figure 1** shows the coverage of the Assessment Area and Surrounding Area.

3.1.2 The Surrounding Area is also extended to include the existing residential development known as Wing Kei Tsuen, Mo Fan Heung, Pok Wai South Road, Tung Shing Lei, Ko Po Road, Fung Kat Heung, Cheung Chun San Tsuen, and OU Site in the CFD model for air ventilation assessment purpose.

3.1.3 It is confirmed that all major elevated structures and planned / committed / existing developments in the model area have been modelled in the simulation. **Appendix 4** indicated the Assessment Area and Surrounding Area of the CFD model.

3.2 Atmospheric Conditions

3.2.1 Simulated wind profile curves are extracted from the Planning Department's website using RAMS site wind availability data and directly adopted for this quantitative AVA. **Figure 3** shows the wind profile curves for Grid X: 055, Y: 073. Wind profile curves 0, 1 and 2 would be utilized for quantitative AVA according to the selected wind directions in **Table 2.1.**

3.3 CFD Code and Major Parameters

3.3.1 A quantitative assessment based on requirement for Initial Study stipulated in the Technical Circular No. 1/06 will be conducted for the purpose to verify the air ventilation performance for the Proposed Scenarios over the Baseline Scenario.

3.3.2 The quantitative assessment will be conducted using a commercial CFD code, FLUENT. FLUENT model has been widely applied for various AVA research and studies worldwide. The accuracy level of the FLUENT model is accepted and recognised by the industry for AVA application.

3.3.3 Realizable K-epsilon turbulence which gives better prediction of separation and vortexes are adopted for air ventilation assessment as recommended in COST action C14.
