[Report Suspicious](#)

Dear [REDACTED]

We generally do not provide comments on traffic figures specifically prepared for Environmental Impact Assessments, as such assessments fall outside our purview.

Nonetheless, if the traffic projections in your submission align reasonably with existing data sources, such as officially approved Traffic Impact Assessments, the Annual Traffic Census, or traffic models endorsed by the TD, we would have no adverse comments on the forecast provided.

Regards,

[REDACTED]
E/TY,TD

Subject: CE 79/2023 (GE) TYNUQ - Technical Note on Traffic Forecast for Environmental Impact Assessment – Issue 1 (Ref. B20e-01)

Dear [REDACTED],

Agreement No. CE 79/2023 (GE)
Underground Quarrying at Tsing Yi North – Investigation, Design and Construction
Technical Note on Traffic Forecast for Environmental Impact Assessment – Issue 1
(Ref. B20e-01)

To facilitate our study on the environmental impact assessment for the captioned project, we are pleased to submit the Technical Note on Traffic Forecast for Environmental Impact Assessment for your review and agreement. A hard copy is being sent to your office.

We would be grateful to have your reply to us on or before 9 December 2025, and grateful if you could also copy your reply to CGE/Mines, GEO, CEDD (fax no. 2714 0193). A nil return is required for record purposes.

Should you have any queries, please contact our [REDACTED] or me at [REDACTED]

Thank you.

Regards,

[REDACTED]

Appendix 4.5 Calculation of Vehicular Emissions

Estimation of Vehicular Emission for the Study Area with EMFAC-HK model

Open road emission contributes to the cumulative air quality in the Study Area during the operation phase. As NO₂ and particulate matters are the key pollutants for the operation phase, the estimation shall also focus on vehicular emission in NO₂ and particulate matters namely RSP and FSP. EMFAC-HK v4.3 model and SAMPv2.1 are adopted to estimate the vehicular emission rates of NO_x and particulate matters including RSP and FSP. The input parameters and model assumptions made in EMFAC-HK model are summarised as follows:

Model Year

EMFAC-HK considers 45 years of model years for the estimation of vehicular emission. The model years start from 45 years preceding the year of interest to the year of interest as the final model year. The following table summarizes the starting and final model years of the assessment year implemented in EMFAC-HK.

Table 1 Starting and Final model years in EMFAC-HK

Scenario Year	Starting Model Year	Final Model Year
2028	1984	2028
2030	1986	2030
2033	1989	2033
2043	1999	2043
2048	2004	2048

Vehicle Emission Standard Implementation Programme and Technology fraction

The “2018 Licensed Vehicle by Age and Technology Group Fractions” provided in EPD’s website, are adopted in this assessment. Since the provided exhaust technology fractions are only up to Year 2018 at the time of the assessment, those after Year 2018 has been adopted by default in EMFAC-HK in accordance with EPD’s Guideline on Modelling Vehicle Emissions – Appendix III “Implementation Schedule of Vehicle Emission Standards in Hong Kong (Updated as in May 2020)” and Appendix IV “EMFAC-HK Technology Group Indexes (Released in January 2021)”.

Vehicle Population

As recommended in the EPD’s Guideline on Modelling Vehicle Emissions, default vehicle populations forecast in EMFAC-HK was used.

Vehicle Accrual

The default accrual rates in EMFAC-HK are estimated from the local mileage data adjusted to reflect the total VKT for each vehicle class. The default value was used.

Vehicle Kilometre Travel (VKT)

The “vehicle fleet” refers to all motor vehicles operating on roads within this assessment area. The modelled fleet was broken down into 18 vehicle classes based on the information in the Transport Monthly Digest and vehicle population provided by EPD.

Vehicle-kilometer-travelled (VKT) represents the total distance travelled on a weekday. The VKT is calculated by multiplying the number of vehicles, which based on the highest predicted hourly traffic flow, and the length of road travelled in the assessment area. The diurnal variation of VKT in the assessment area was provided by the traffic consultant, and the input in the model is by vehicle/fuel/hour.

Vehicle Speed

Vehicle speed on each road link at each hour was provided by the traffic consultant. All the vehicle classes on the same road link were assumed to have the same travelling speed, except medium goods vehicles, heavy goods vehicles, buses and public light buses.

In accordance with the Road Traffic Ordinance, for any road with design speed limit of 70 kph or above, the speed limit for medium goods vehicles, heavy goods vehicles and buses would be limited to not more than 70 kph. Thus, the speeds of medium goods vehicles, heavy goods vehicles and buses from the flow speed or 70 kph, whichever is lower, were adopted. For the public light buses, the speed limit should be limited to post speed of the carriageway or 80 kph, whichever is lower, were adopted.

Temperature and Humidity Profile

The WRF meteorological data are extracted from PATHv3.0 to estimate the vehicular emission factors. For the estimation of air quality impact of short-term NO₂ (i.e., hourly NO₂ and daily NO₂), short-term and long-term RSP (i.e., daily RSP and annual RSP) and short-term and long-term FSP (i.e., daily FSP and annual FSP), an approach of using daily profile of lowest temperature and relative humidity data in each hour for each month was adopted. For long-term NO₂ (i.e., annual NO₂), an approach of using daily profile of averaged temperature and relative humidity data in each hour for each month was adopted.

Trips

Start emissions of all 18 vehicles classes were assigned on local / rural roads with post speed of 50 km/hr with the number of trips for each vehicle class assumed directly proportional to VKT (Trips per VKT) and is estimated by the following formula:

$$\begin{aligned} & \text{Trip for local or rural roads within the study area} \\ &= \text{VKT for local or rural roads within the study area} \\ & \quad \times \frac{\text{Trip for local or rural roads within Hong Kong}}{\text{VKT for all roads within Hong Kong} \times \text{Proportion of roads with potential start emission}} \end{aligned}$$

Default trips and VKT values from EMFAC-HK are used in SAMP v2.1. The proportion of local and rural roads within Hong Kong refer to the latest Annual Traffic Census 2024 (3.74%). VKT within the study area was calculated by multiplying the number of vehicles by the distance travelled within the study area.

The highest NO_x (and the corresponding NO and NO₂), RSP and FSP start emission factors for each vehicle class among different soak time were adopted as a conservative approach.

Estimation of Composite Vehicular Emission Factor

Referring to the EPD's Guideline on Modelling Vehicle Emissions, "Emfac mode" was used for calculating emission factors in terms of grams of pollutants emitted per vehicle activity. It was applied for this Project, since it provides the emission factors according to the actual hourly travelling speeds of vehicles of each road.

Assuming that NO_x is comprised of NO and NO₂ only, the hourly emission of NO was calculated as the difference in emissions between NO_x and NO₂ extracted from EMFAC-HK for each vehicle type.

The hourly emissions of NO_x, RSP and FSP were divided by the number of vehicles and the distance travelled to obtain the emission factors in gram per miles per vehicle. In addition, the "zero emission vehicle scenario" of SAMPv2.1, which consider the projected population and proportion of zero emission vehicles (ZEV), such as electric vehicles, is enabled to provide more realistic estimation. The projections of ZEV for different vehicle classes, according to the *Summary of assumptions for projecting vehicle population & emissions* by EPD. The calculated 24-hour emission rates of 18 vehicle classes for each road are then adopted in the subsequent air dispersion modelling (i.e. AERMOD).

Vehicular Emission Burden by EMFAC-HK

Vehicular emission burden (Emission from Open Roads and Tunnels) for NO_x, RSP and FSP were calculated based on the traffic forecast, SAMPv2.1 and EMFAC-HK v4.3 model. The vehicular emission burden for Traffic Design Scenarios A and B summarized as below:

Table 2 Vehicular Emission Burden of Open Road Sources and Tunnels

Year	Vehicular Emission Burden (Tonne Per Year)					
	RSP		FSP		NO _x	
2028	2.60		2.39		62.82	
2030	2.11		1.94		49.07	
Traffic Scenario	A	B	A	B	A	B
2033	1.27	1.29	1.17	1.19	29.78	30.52
2038	0.68	0.70	0.62	0.64	18.54	19.17
2043	0.60	0.62	0.55	0.57	14.47	14.98

Remark:

[1] The annual lowest temperature and relative humidity are adopted to estimate the annual vehicular emission burden.
