Remark

1. $R = E_r \cdot t \cdot d_r \cdot p$
where
R: running emission at a specific speed for a vehicle type with a fuel type in an hour;
E_r: running emission factor for the vehicle type at the specific speed, obtained from the EMFACEInf tab;
t: total traffic frequency of the vehicle type in the hour, obtained from the Frequency table;
d_r: average travelling distance within PTI, obtained from the Site Parameters table;
p: vehicle percentage of the fuel type, obtained from the Vehicle Parameters table.

[illegible]

Remark

1. $S_{\text{start}} = \sum_i (E_{s,i} \cdot f_i) \cdot p$
 where
 S_{start} : total start emission for a vehicle type with a fuel type in an hour,
 $E_{s,i}$: start emission factor of the vehicle type with sitting time i min, obtained from the EMFACemf tab,
 f_i : traffic frequency of the vehicle type with sitting time i min in the hour, obtained from the Traffic Flow to
 p: vehicle percentage of the fuel type, obtained from the Vehicle Parameters table.

Mark

$$I = E_0 + T_1 \cdot (\frac{t}{\tau} - p) + E_{-1} \cdot (\frac{\tau}{t} - p)$$

where:

- i. sliding emission within PTV of a vehicle type with a fuel type in one term (terminating vehicle);
- j. cold start emission rate of the vehicle type with the fuel type, obtained from the Vehicle Parameters table;
- k. hot start emission rate of the vehicle type with the fuel type, obtained from the Vehicle Parameters table;
- l. ending time of the terminating vehicle, obtained from the Vehicle Parameters table;
- m. arrival percentages of the fuel type, obtained from the Fuel Parameters table;
- n. total traffic frequency of the vehicle types with the fuel type for cold starting emission, obtained from the Traffic Flow table of the vehicle type;
- o. total traffic frequency of the vehicle types with the fuel type for hot start emission, obtained from the Traffic Flow table of the vehicle type.

2. According to Calculation of Start Emission in Air Quality Impact Assessment, the soak time for cold idling is longer than or equal to 240 min per petrol/PVG vehicles & 60 min diesel ICGT vehicles

- Notes of Surface Characteristics of Grid 30_36:
- 1. Reference to AERMOD Implementation Guide, the determination of the albedo should be based on a simple unweighted arithmetic mean (i.e., no direction or distance dependency) for the same representative domain as defined for Bowen ratio, with a default domain defined by a 10km by 10km region centered at the measurement site.
 - 2. Reference to AERMOD Implementation Guide, the determination of the Bowen ratio should be based on a simple unweighted geometric mean (i.e., no direction or distance dependency) for a representative domain, with a default domain defined by a 10km by 10km region centered on the measurement site.
 - 3. Surface roughness length is based on an upwind distance of 1km relative to the grid.
 - 4. The parameters such as Inverse-Distance, Albedo, Bowen Ratio, and Surface Roughness are extracted from the Smart Air Modelling Platform (SAMP) version 2.1 developed by the Hong Kong Environmental Protection Department (HKEPD).

Land Utilization in Hong Kong 2024

- Note:
- [1] The land utilization area is determined based on the Hong Kong Planning Department Classification.
 - [2] The spatial center of each grid is determined by the location of the air-sensitive receivers within that grid. AERMET files are generated by inputting the locations of air-sensitive receivers (ASRs) and the site boundary using the SAMP version 2.1.

1. Reference to AERMOD Implementation Guide, the determination of the albedo should be based on a simple unweighted arithmetic mean (i.e., no direction or distance dependency) for the same representative domain as defined for Bowen ratio, with a default domain defined by a 10km by 10km region centered at the measurement site.
2. Reference to AERMOD Implementation Guide, the determination of the Bowen ratio should be based on a simple unweighted geometric mean (i.e., no direction or distance dependency) for a representative domain, with a default domain defined by a 10km by 10km region centered on the measurement site.
3. Surface roughness length is based on an upwind distance of 1km relative to the grid.
4. The parameters such as Inverse-Distance, Albedo, Bowen Ratio, and Surface Roughness are extracted from the Smart Air Modelling Platform (SAMP) version 2.1 developed by the Hong Kong Environmental Protection Department (HKEPD).

Note:

- [1] The land utilization area is determined based on the Hong Kong Planning Department Classification.
- [2] The spatial center of each grid is determined by the location of the air-sensitive receivers within that grid. AERMET files are generated by inputting the locations of air-sensitive receivers (ASRs) and the site boundary using the SAMP version 2.1.

Jenkin Method for Long-term Cumulative NO₂ Assessment

With reference to the *Review of Methods for NO to NO₂ Conversion in plumes at short ranges*¹, Jenkin method was adopted for the conversion of cumulative annual average NO_x to NO₂ by using the functional form of annual mean of NO₂-to-NO_x. The mentioned functional form is referenced from Jenkin, 2004a² and is presented below:

$$[NO_2] = \frac{([NO_x] + [OX] + \frac{J}{k}) - \sqrt{([NO_x] + [OX] + \frac{J}{k})^2 - 4[NO_x][OX]}}{2}$$

where

- [NO₂] is the NO₂ concentration
- [NO_x] is the NO_x concentration
- [OX] is the sum of NO₂ concentration and O₃ concentration (i.e. [OX] = [NO₂] + [O₃])
- J is the photolysis rate of NO₂
- k is the rate coefficient for reaction between NO and O₃

The above functional form was used to analyze the annual mean data obtained from the nearest EPD's air quality monitoring stations (AQMS) including Tsuen Wan general station, Tap Mun general station and Roadside AQMS (i.e. Mong Kok roadside station). The recent five years annual mean data are extracted and presented in below table. Scattered plot for recent 5 years annual means NO₂ versus NO_x concentrations obtained from relevant AQMS was created. The functional form curve would fit the annual mean data when [OX] = 95.57 µg/m³ and J/k = 17.114 µg/m³. The value of [OX] and J/k are considered reasonable as they are within typical value range for Hong Kong. The resulting functional form curve was adopted for the cumulative annual average NO_x to NO₂ conversion. The curve is slightly higher than all the annual mean data obtained from AQMS, the calculated annual average NO₂ concentration using the obtained functional form curve based on the observed annual average NO_x obtained from AQMS are presented in below table, the calculated annual average NO₂ concentration are higher than the observed annual average NO₂ concentration, no underestimation of the annual average NO₂ concentration is expected.

For the long-term cumulative NO₂ assessment (i.e. predictions of annual average NO₂ concentration), cumulative annual average NO_x to NO₂ conversion equation for this assessment was calculated as follows:

$$[NO_2]_c = \frac{([NO_x]_c + 95.57 + 17.11) - \sqrt{([NO_x]_c + 95.57 + 17.11)^2 - 4[NO_x]_c \times 95.57}}{2}$$

where

- [NO₂]_c is the predicted cumulative NO₂ concentration
- [NO_x]_c is the predicted cumulative NO_x concentration

Remark

[1] Worst affected level of each ASR is highlighted.

[2] The annual NO2 concentrations are calculated by Jenkin Method, the detailed equations and steps are presented in Appendix 3.8

[3] Air purification system with at least 10% NO2 removal efficiency will be provided such that no adverse impact is expected. The predicted values before application of air purification system are 42.44µg/m³ and 40.46µg/m³ at 1.5mAG and 5mAG at A02 respectively.

Notes:

- *

Unless specified otherwise, references were made to Study on Marine Vessels Emission Inventory (MVEIS)
- ^

Operation mode refers to Table 3-24 of MVEIS.
- [1]

No breakdown of RTV types are available in the traffic data. Therefore, vessel types catalogized by the Marine Department is adopted to breakdown the marine traffic data. (https://www.mardep.gov.hk/filemanager/en/share/fact/pdf/portstat_2_y_a2.pdf)
- [2]

According to data from marine consultants, tugs and cross boundary ferry are classified as an independent vessel type and are consequently excluded from calculation of marine emission of RTV.
- [3]

The Main Engine type refers to S4.2.6 of MVEIS
- [4]

According to the Air Pollution Control (Marine Light Diesel) Regulation, the sulphur content of locally supplied marine light diesel is capped at 0.05%; Locally supplied marine light diesel oil are assumed to be used for refueling RTVs in Hong Kong.
- [5]

The GRT sub-group refers to Table 4-5; the highest GRT for each vessel type is adopted as a conservative approach.
- [6]

The average ME Power refers Table 4-5 of MVEIS
- [7]

— The SO2 emission factor is calcaulted based on the formula stated in Paragraph 4.2.31 of MVEIS: BSFC x 2 x 0.97753 x Fuel Sulphur Fraction, where BSFC for main engine installed in RTV is 213 and Fuel Sulphur Fraction is 0.0005.

— The emission factors for NOx refer to Table 4-16 of MVEIS.

— The RSP emission factors for Main Engine were calcaulted based on the formula stated in Paragraph 4.2.31 of MVEIS: 0.23* BSFC x 7 x 0.02247 x (Fuel Sulphur Fraction - 0.0024), where BSFC for main engine installed in RTV is 213 and Fuel Sulphur Fraction is 0.0005.

— According to Paragraph 4.2.32 of MVEIS, the RSP to FSP conversion factor is 0.97.
- [8]

The average speed and sailing route are provided by marine traffic consultant. The time-in-mode is calculated as: Time-in-mode (hr) = Maximun Length of Sailing Route within Assessment Boundary (nautical miles) / Average speed (knot)
- [9]

The ME Load Factor refers to Table 4-7 of MVEIS
- [10]

The calculations of emission rates refer to the following equation: Emission Rate (g/s) = Engine Power (kW) * Time-in-mode per hour * Engine Load Factor * Emission Factor (g/kWh) / 3600 , where Time-in-mode per hour refers to the duration ratio of a vessel operating in a specific mode within a one-hour period (i.e., Time-in-mode (hr) / 1 hour)

SSD, MSD, HSD and ST denote slow speed diesel, medium speed diesel, high speed diesel and steam turbine engine, respectively.
- [3]

Proportion of main engine type refers to Table 3-17 of MVEIS
- [4]

DWT / PAX Sub-Group refers to Table 3-18 of MVEIS; the highest DWT/PAX is adopted as a conservative approach
- [5]

All vessels are required to use compliant fuels (sulphur content <= 0.5%) under the Air Pollution Control (Fuel for Vessels) Regulations. Therefore, it is assumed that all vessels use MDO with a sulphur content of 0.5%.

AE to ME Power Ratio refer to Table 3-20 of MVEIS

The AE Power is calculated by the following equation: AE Power = ME Power * AE to ME Power Ratio

According to Page 71 of IMO Fourth Greenhouse Gas Study, it is assumed the Auxiliary Engines Specific Fuel Consumption Specific Fuel Consumption = Baseline Specific Fuel Consumption of AE. The baseline specific fuel consumption of AE refer to Table 19 of IMO Fourth Greenhouse Gas Study 2020

— The SO₂ emission factor refer to Table 3-29 of the MEVIS

— The NO_x emission factors for NO_x refer to Table 49 of IMO Fourth Greenhouse Gas Study 2020 Annexes

The RSP emission factors were calculated by Equation 17 of IMO Fourth Greenhouse Gas Study 2020: 0.23 + SFC_i * 7 * 0.02247 * (Fuel Sulphur Fraction - 0.0024), where Fuel Sulphur Fraction is 0.005, and i denotes the specfic engine/boiler system (i.e., Engine/Boiler Type and Fuel Type) for each vessel type. According to the Forth IMO Greenhouse Gas Study, the RSP to FSP conversion factor used is 0.92

The Auxiliary Engine Load Defaults (Auxiliary Engine Load * Auxiliary Engine Power) for FCCV is adopted and presented (Table 3-22). Therefore, AE to ME power ratio and AE load factor are not used for FCCV

The NO_x emission factors for NO_x refer to Table 49 of IMO Fourth Greenhouse Gas Study 2020 Annexes

The AE Load Factors of all vessel types, expect FCCV and Cruise/Ferry, refer to “Emission estimate methodology for maritime navigation” (<https://www3.epa.gov/ttnchie1/conference/ei19/session10/trozzi.pdf>), the load factor of “Cruise” phase is adopted. The AE load Factor of Crusie/Ferry refer to Table 3-21 of MVEIS

The calculations of emission rates refer to the following equation: Emission Rate (g/s) = Engine Power (kW) * Time-in-mode per hour * Engine Load Factor * Emission Factor (g/kWh) / 3600 , where Time-in-mode per hour refers to the duration ratio of a vessel operating in a specific mode within a one-hour period (i.e., Time-in-mode (hr) / 1 hour)

According to Page 71 of IMO Fourth Greenhouse Gas Study, it is assumed the Auxiliary Boiler Specific Fuel Consumption Specific Fuel Consumption = Baseline Specific Fuel Consumption of AB. The baseline specific fuel consumption of AB refer to Table 19 of IMO Fourth Greenhouse Gas Study 2020
- [3]

The SO₂ emission factor refer to Table 3-29 of the MEVIS
- [4]

The NO_x emission factors for NO_x refer to Table 49 of IMO Fourth Greenhouse Gas Study 2020 Annexes

The RSP emission factors were calculated by Equation 17 of IMO Fourth Greenhouse Gas Study 2020: 0.23 + SFC_i * 7 * 0.02247 * (Fuel Sulphur Fraction - 0.0024), where Fuel Sulphur Fraction is 0.005, and i denotes the specific engine/boiler system (i.e., Engine/Boiler Type and Fuel Type) for each vessel type. According to the Forth IMO Greenhouse Gas Study, the RSP to FSP conversion factor used is 0.92

Notes:

[1] The hourly traffic volume is provided by marine traffic consultant and agreed by Marine Department. The highest traffic flow within 15 years after commencement is adopted as a conservative assumption. Moreover, it is noted that not all vessels passing the gate navigate within the 500 m assessment boundary. As such, the marine traffic flow has been divided into three routes , with reference to the approved EIA for the Tsing Yi–Lantau Link, in which three principal navigation routes are defined within the fairway.

[2] No breakdown of OGV types are available in the traffic data. Therefore, the hourly traffic volume of each vessel type is calculated by the following equation: Hourly traffic volume of OGV * Proportion of Arrivals by vessel type

[1] The hourly traffic volume is provided by marine traffic consultant and agreed by Marine Department. Moreover, it is noted that not all vessels passing the gate navigate within the 500 m assessment boundary. As such, the marine traffic flow has been divided into three routes , with reference to the approved EIA for the Tsing Yi–Lantau Link, in which three principal navigation routes are defined within the fairway.

[2] No breakdown of RTV types are available in the traffic data. Therefore, the hourly traffic volume of each vessel type is calculated by the following equation: Hourly traffic volume of RTV * Proportion of Arrivals by vessel type

Unless specified otherwise, references are made to Study on Marine Vessels Emission Inventory (MVEIS)
- [1]

Classification of vessel type refer Table 4-1 of MVEIS, Small Craft and Fast Launch are classified as "Others (GRT >= 1000)" as a conservative estimation
- [2]

The main engine type refers to S4.2.6 of MVEIS
- [3]

According to the Air Pollution Control (Marine Light Diesel) Regulation, local vessel in Hong Kong should be using marine light diesel with sulphur content of 0.05%.
- [4]

The average ME Power refer to Table 4-5 of MVEIS
- [5]

— The SO2 emission factors were calcaulted based on the formula stated in Paragraph 4.2.31 of MVEIS: BSFC x 2 x 0.97753 x Fuel Sulphur Fraction, where BSFC for main engine installed in RTV is 213 and Fuel Sulphur Fraction is 0.0005.

— The NOx emission factors for refer to Table 4.16.

— The RSP emission factors were adjusted based on the formula stated in Paragraph 4.2.31 of MVEIS: The formula of RSP Emission Factor is 0.23+ BSFC x 7 x 0.02247 x (Fuel Sulphur Fraction - 0.0024), where BSFC is 213 and Fuel Sulphur Fraction is 0.0005.

— According to Paragraph 4.2.32 of MVEIS, the RSP to FSP conversion factor is 0.97.

The average speed and sailing route provided by Marine Traffic Consultant. Moreover, the time-in-mode is calculated as: Time-in-mode (hr) = Maximun Length of Sailing Route within Assessment Boundary (nautical miles) / Average speed (knot)
- [7]

The load factors are determined from Table 4-7 of MVEIS.
- [8]

The calculations of emission rates refer to the following equation: Emission Rate (g/s) = Engine Power (kWh) * Time-in-mode per hour * Engine Load Factor * Emission Factor (g/kWh) / 3600 , where Time-in-mode per hour refers to the duration ratio of a vessel operating in a specific mode within a one-hour period (i.e., Time-in-mode (hr) / 1 hour)

Underground Quarrying at Tsing Yi North
Hazard Register (After unloading the explosives to the Contractor)

Item No.	Potential Hazard Item	Possible Consequence	Potential Causes	List of Recommended Control Measures
Operation Phase				
1	Accidental Initiation of Explosives during Transport to Blast Faces	Fatalities of off-site population due to blast and overpressure waves	❶ Explosives load to be initiated when the load is engulfed by a non-crash fire of the explosive carrying vehicle for a period of time	◆ Use of secure, flame-resistant packaging / stowage of explosives (e.g., approved containers, flame-proof tarpaulins), with separation from vehicle heat sources (e.g., exhaust, batteries); prohibit mixing with other flammables, so that the explosives could not be detonated. No ferrous fixtures to be part of the explosive storage compartment.
			❶ Explosives load to be initiated when the load is engulfed by a crash fire of the explosive carrying vehicle for a period of time	◆ Equip the explosives transport vehicle with fully charged, multi-purpose dry-chemical fire extinguishers, which should be readily accessible to the driver and inspected regularly, so that any fire incident can be extinguished as soon as practicable.
			❶ The stability of the explosives load is affected by a significant mechanical impact during vehicle collision and initiate the explosion	◆ Implement speed limit within the construction sites, no significant collision is expected.
			❶ Spontaneous explosion of "unsafe explosives" resulting from breach of regulations caused by badly packaged, maunfactured, and / or 'out-of-specification' explosives	◆ Only use explosives approved for use by Mines Division. Separate transport of detonators from explosives and require qualified personnel (e.g., Registered Shotfirers and Resident Explosive Supervisors) to handle acceptance, inspection, and documentation. No unauthorised personnel allowed within designated zone of loading and unloading locations
				◆ The explosives are supplied by the CEDD Mines Division. The conditions of explosives will have been duly checked before unloading from the Kau Shat Wan Explosive Depot. Return the detonators or surface connectors to CEDD Mines Division if there are any badly packaged, manufactured, and/or 'out-of-specification' explosives.
				◆ If a thunderstorm warning has been issued by the Hong Kong Observatory, the delivery of explosives may be delayed or cancelled by Mines Division. If explosives are delivered, an assessment of the risks involved in transporting the explosives to the blast face(s) and unloading of explosives from the delivery vehicles will be made by the BE, RSF and the Mines Division Explosive Officer. A Lightning Detector will be used to indicate the weather conditions.

Underground Quarrying at Tsing Yi North

Hazard Register (After unloading the explosives to the Contractor)

Item No.	Potential Hazard Item	Possible Consequence	Potential Causes	List of Recommended Control Measures
2	More than the design MIC initiated during blasting	Fatalities of off-site population due to blast and overpressure waves	❶ Manufacturer defect of the detonators or the surface connectors	◆ Conduct thorough inspection upon receipt of detonator / explosive delivery: visually check packaging for damage, leaks, improper labeling / markings. Return the detonators or surface connectors to CEDD Mines Division if there are any manufacturer defects. Blast door at tunnel portal
		Stability of nearby building being affected by more than expected ground vibration, falling objects or building collapse resulted	❶ Wrong design of time delay of a blast face	◆ Use blast design software to model timing sequences, relief rates, and interactions; review against site geology and vibration limits. Ensure sufficient delay time interval (e.g. 8ms) during the blast design. Independent check of time delay for each blasting interval and endorsed by the Blasting Competent Supervisor (BCS).
		Stability of nearby slopes being affected by more than expected ground vibration and resulted in landslide	❶ Detonator put into wrong hole	◆ Clear demarcation on the rock face surface per blast hole. Primer assembly and Charging done by Qualified Shotfirers only using authorized methods under the supervision by RES. Independent check of time delay of each blast hole by Blasting Competent Supervisor before permission to blast is given.
		Stability of nearby terrains being affected by more than expected ground vibration and resulted in landslide or boulder fall	❶ Connection of a Detonator to a Wrong Surface	◆ Follow connection method as per approved blast design. Hook-up is inspected by Blasting Engineer. Use standardized connection procedures with visual aids (e.g., diagrams, color-coded trunk lines/connectors). Mark up the boundaries of each surface sector by paint on the rock face
		Blasting induced flyrock / fragments / missiles	Use of a Wrong Surface Connector	◆ Carry out pre-blast inventory check and reconciliation against design quantities/delays. Blast door at tunnel portal
			More bulk emulsion explosives loaded into a production hole than required	◆ Require loading logs with measured volumes per hole; cross-check against design powder factor. Supervision of loading of each blast hole by Resident Explosive Supervisor (RES)
			❶ More cartridge sticks loaded into a production hole than required	◆ Calculate and mark exact number of cartridges per hole based on design; use counting during loading. Supervision of loading of each blast hole by Resident Explosive Supervisor (RES)
			❶ Incorrect blasthole nos., length or diameter	◆ Use computer-controlled drilling jumbo and follow approved blast design for blast holes drilling. Blasthole length and diameter to be independently checked and confirmed as correct by Resident Explosive Supervisor before loading of explosives is permitted
				◆ Blast doors will be installed at the tunnel portals to prevent any flyrock hazard and air overpressure.
				◆ Inspection of critical sensitive receivers (e.g. building / utilities / slope) to be carried out after each blast to confirm the conditions are not affected by the blasting works.

Underground Quarrying at Tsing Yi North
Hazard Register (After unloading the explosives to the Contractor)

Item No.	Potential Hazard Item	Possible Consequence	Potential Causes	List of Recommended Control Measures
				Carry out the pre-tender and Contractor's blasting assessment to identify sensitive receivers by a Blasting Competent Person. The blasting assessment and blasting method statement will be submitted to CEDD Mines Division for approval before obtaining the blasting permissions. Blasting operations to be closely supervised by the Chief Registered Shot Firer, Blasting Engineer (BE), Blasting Resident Explosive Supervisors (RES), and Blasting Competent Supervisors (BCS)
